NEURALSPLAT

Space Studio

User manual

Show your customers their own room, tiled and fitted, before a single tile is laid. This guide takes you from a brand-new account to your first design: creating a space from your customer's room, adding your tiles and products, then tiling, measuring, sharing and quoting.

For sales teams, designers and showroom staff · October 2026

Your first visit

A new account starts empty: no spaces and no tiles. Four steps get you from there to a design you can show a customer.

1. Create your first space	Turn a photo of a room into a 360° space, or capture one with your phone. It takes a few minutes. *Section 2*.
2. Add your tiles	Upload pictures of the tiles you sell, check their details and approve them. *Section 3*.
3. Add sanitary ware	Optional: upload the commodes, basins and other products you sell. *Section 4*.
4. Design	Open your space, tile it, swap fixtures, measure, then share it or quote it. *Sections 5 to 12*.

Tip. In a hurry? **Quick apply** (section 14) tiles an ordinary photo in seconds, with no space to build first. You still need tiles in your catalog.

Note. The screenshots in this manual come from an account that already has spaces and tiles. Yours will look emptier until you have added your own.

SECTION 1

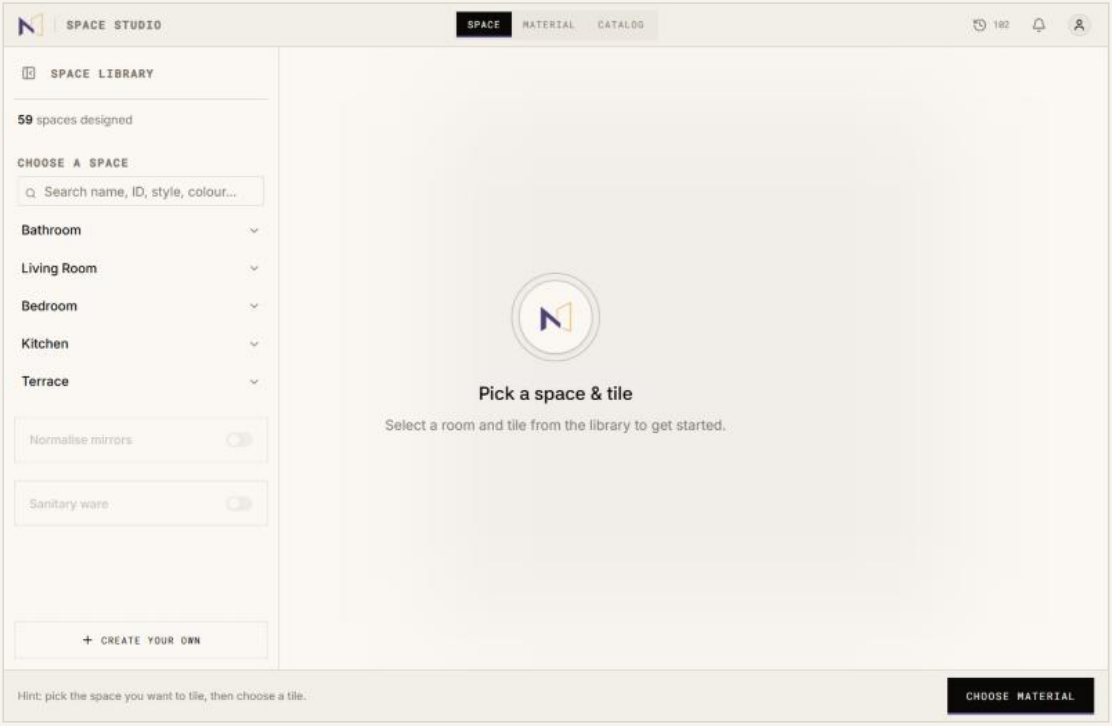

Getting started

Sign in and find your way around the screen.

Signing in

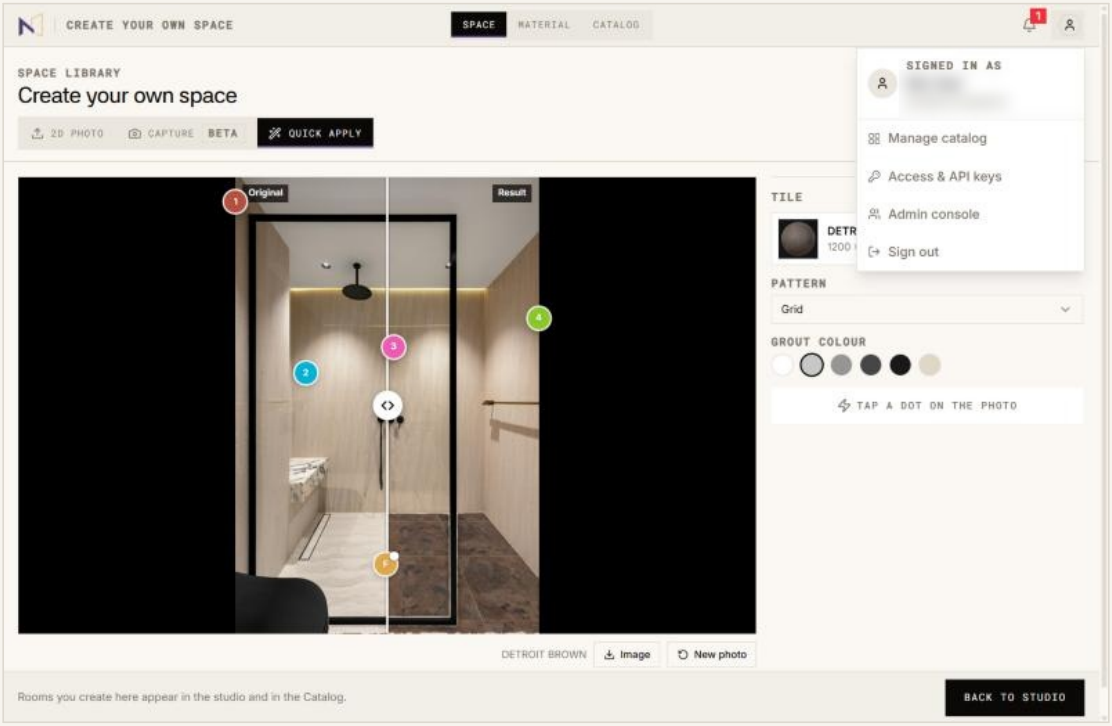

Open the address your company gave you and sign in with your username and password, or with **Continue with Google**. Tick **Remember me** on your own device so you stay signed in. You land in the **Space Studio**.

The screen at a glance

The studio. On a new account the space library on the left is empty until you create your first space.

Space · Material · Catalog	The three modes, at the top. **Space** is where you pick a room, **Material** is where you tile it, **Catalog** is where you browse every room and product.
Create your own	At the bottom of the space library: where every new space starts.
Clock icon	Your sessions: every room you have worked on, newest first.
Bell	Notifications, such as a space that has finished building.
Person icon	Your profile, **Manage catalog** (where tiles and products are added) and **Sign out**.
Bottom bar	A hint about the next step, and the button for it. Once a room is tiled it also holds History, VR, sharing and more.

The profile menu: Manage catalog, and Sign out at the bottom.

SECTION 2

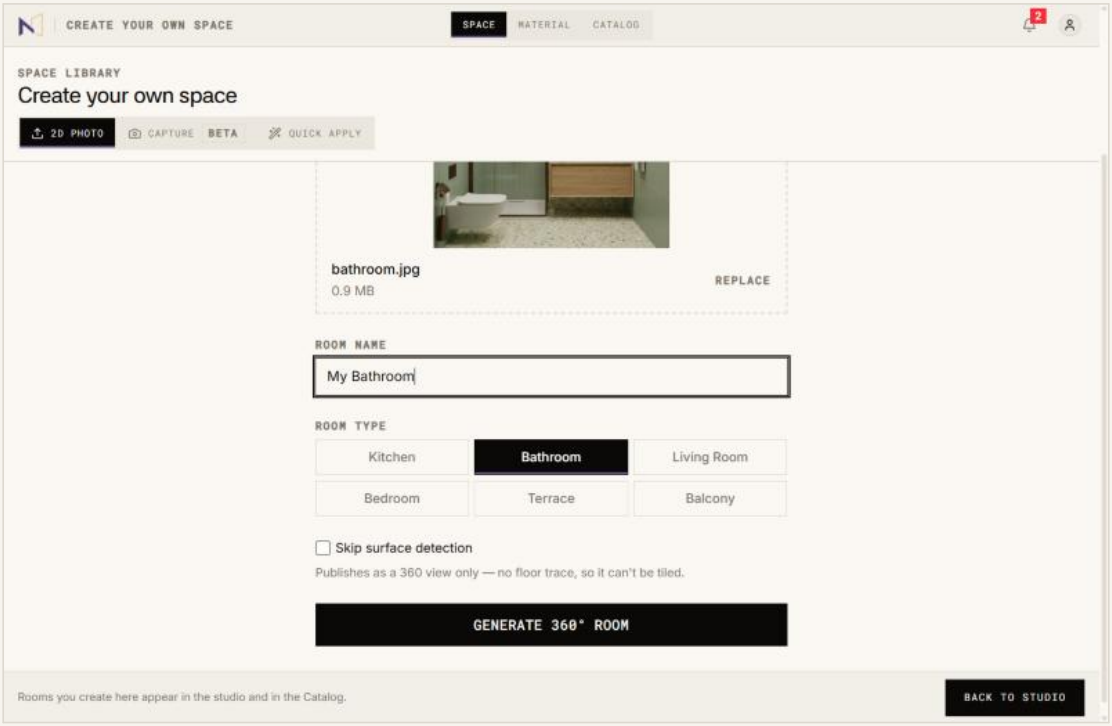

Create your first space

A space is a full 360° view of a room that you can look around, tile and fit. Make one from your customer's room.

Click **Create your own** at the bottom of the space library. There are two ways to make a space; a third tab, **Quick apply**, works on a single photo instead (section 14).

From a photo

1. Choose the **2D Photo** tab.
2. Drop a photo of the room into the box, or click it to choose one (JPG, PNG or WebP).
3. Give the room a **name**: the one the studio and the catalog will show.
4. Pick the **room type**: Kitchen, Bathroom, Living Room, Bedroom, Terrace or Balcony.
5. Press **Generate 360° room**. The rest of the room is built around your photo.

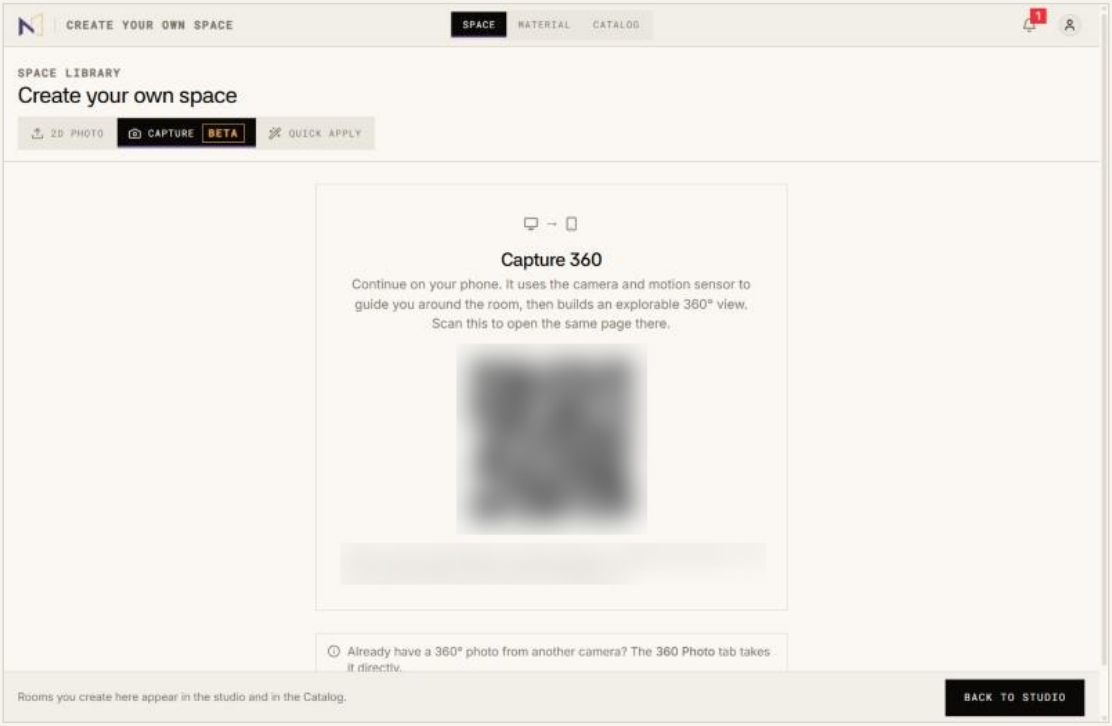

A bathroom photo chosen, named and typed, ready to generate.

> **Tip.** Take the photo from a corner, standing back, with as much of the floor and walls in view as you can, in good light. Leave **Skip surface detection** unticked: without it the space can be viewed but not tiled.

With your phone (Capture)

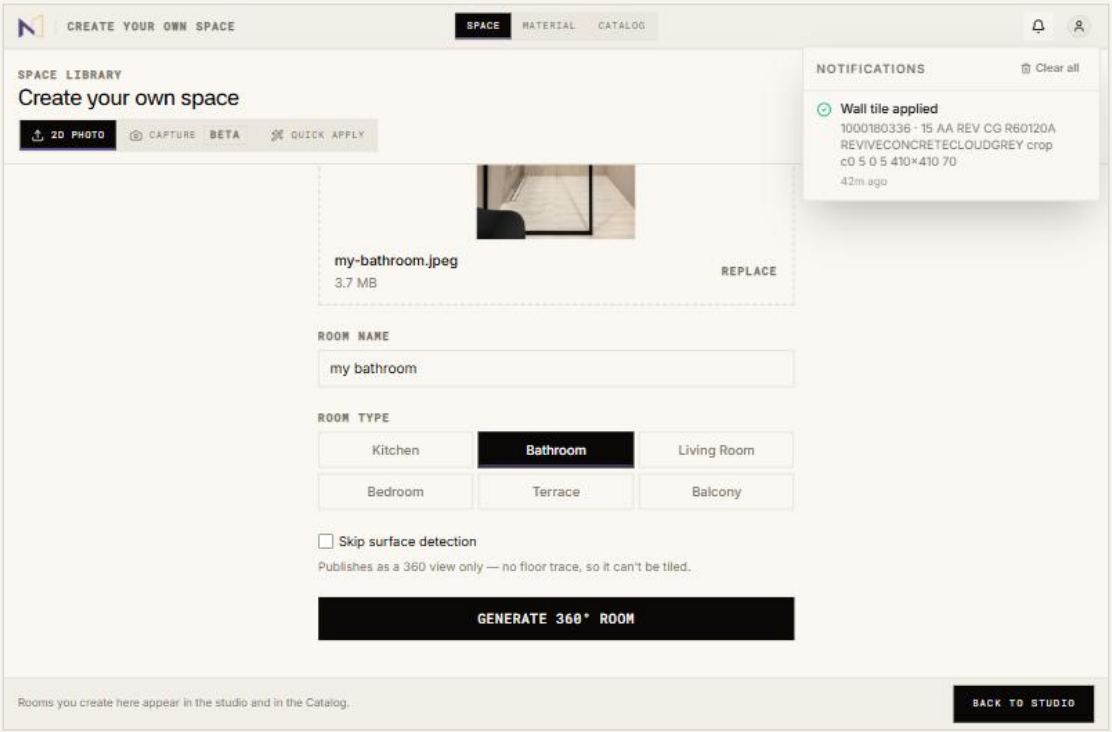

The **Capture** tab (beta) shows a **QR code**. Scan it with an iPhone and the phone guides you around the room, taking the pictures itself. The 360° view is built from them on the server, so you do not need to stitch anything.

Capture: scan the code with your phone. (The code is blurred here.)

While it builds

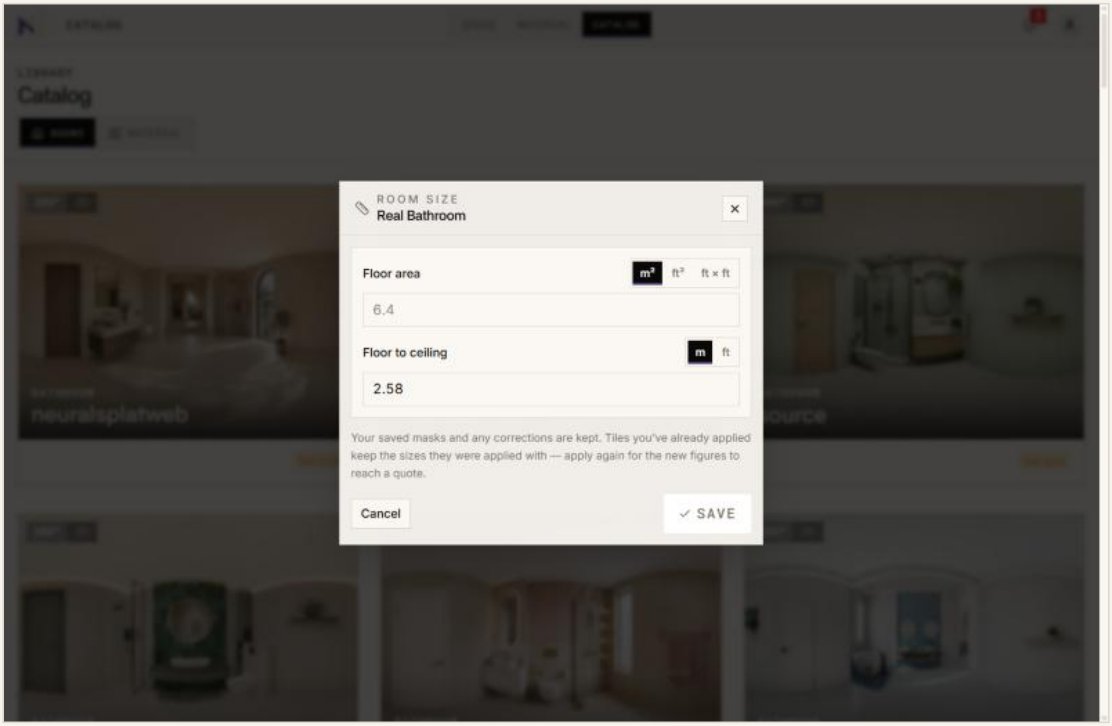

- Building a space takes **a few minutes**. You can leave the page and keep working.
- The **bell** at the top tells you when it is ready.
- Your new space then appears in the **space library** (Space mode, under its room type) and in the **Catalog**.

Notifications: the bell lists what has finished.

Set the room's real size

A photo cannot tell how big a room is, so the space starts at an estimated size. Before you quote, give it the real size: open **Catalog**, find the room's card and press **Set size**. Enter the **floor area** (m^2, ft^2 or feet by feet) and the **floor to ceiling** height, then **Save**. Tile sizes, measurements and quantities all follow from it.

Room size: the real floor area and ceiling height.

SECTION 3

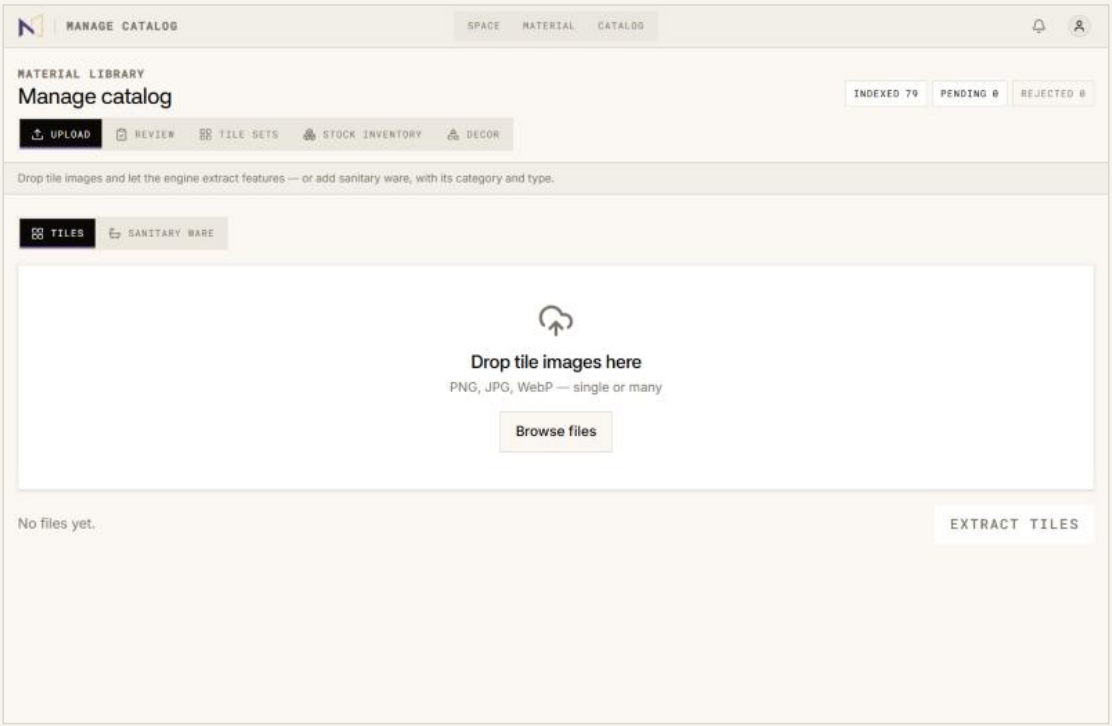

Add your tiles

The studio can only offer the tiles in your catalog. Upload pictures of the ones you sell; they are read automatically, and appear once approved.

Who can do this. Adding tiles and products is done in **Manage catalog** (person icon at the top right) and is open to your company's **admins**. The first user of a new company account is its admin. If you cannot see Manage catalog, ask your admin to add the tiles.

Upload

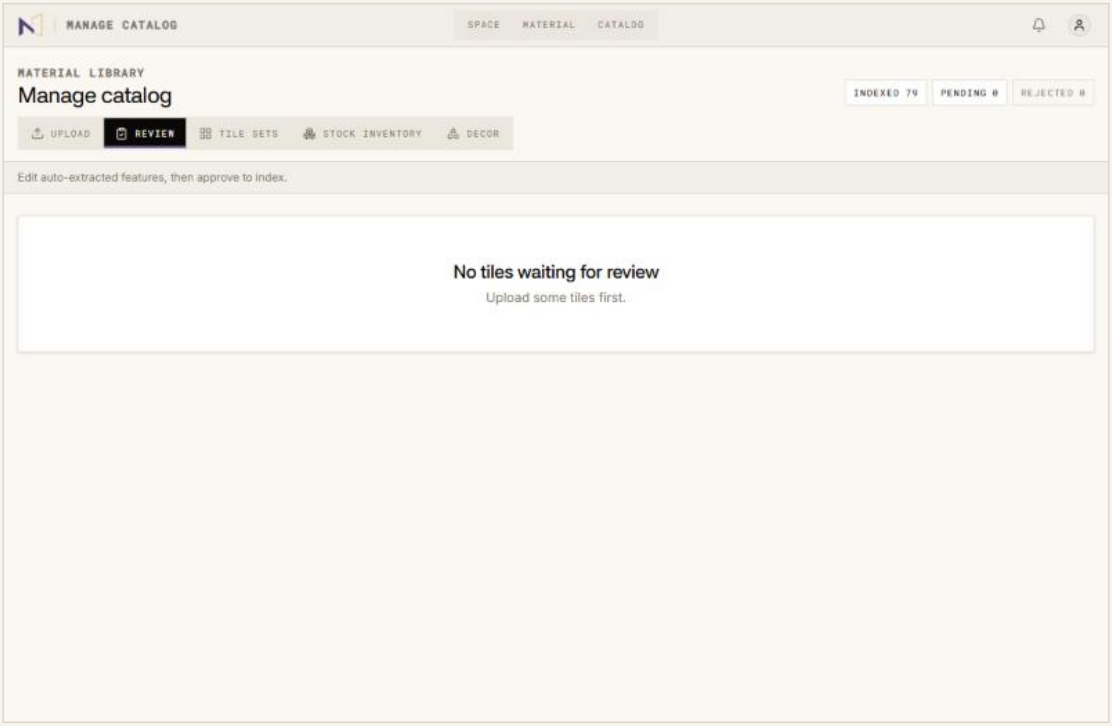

1. Open **Manage catalog** from the person icon (or **Add your tiles** at the bottom of the Material panel in the studio).
2. On the **Upload** tab, make sure **Tiles** is selected.
3. Drop your tile pictures in, or press **Browse files** (PNG, JPG or WebP, one or many at once). A straight-on photo or scan of a single tile works best.
4. Press **Extract tiles**. Each picture is read for its size, colour, finish and style.

Manage catalog → Upload → Tiles. The counters at the top right show how many tiles are indexed, pending and rejected.

Review and approve

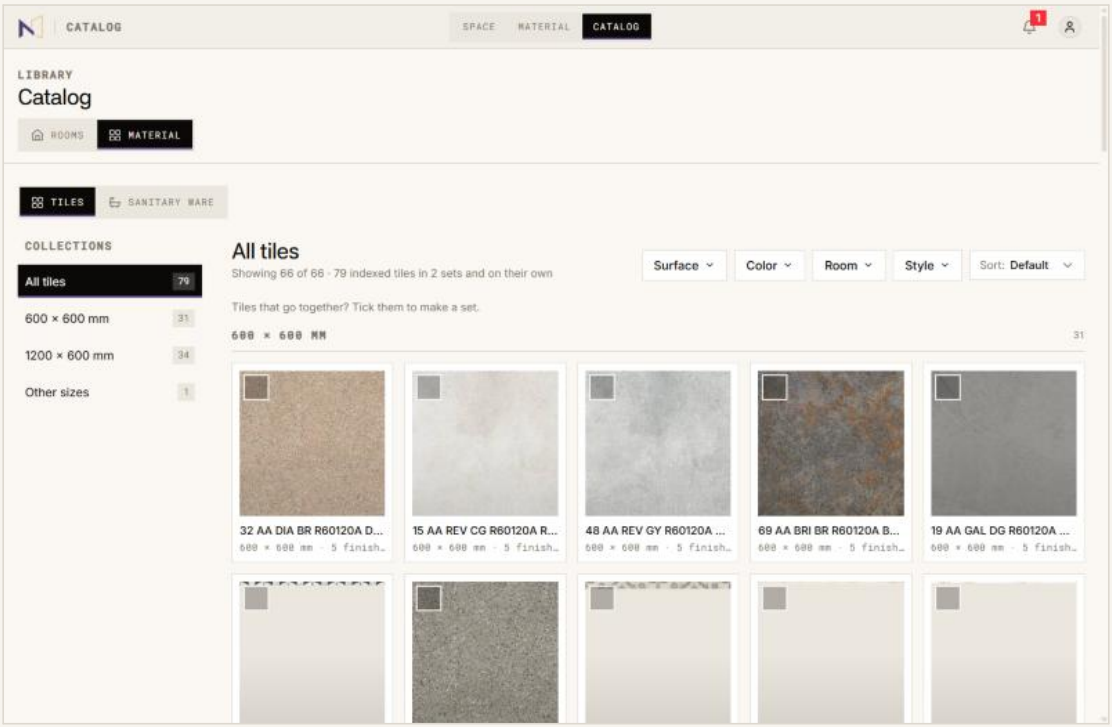

1. Open the **Review** tab. Every uploaded tile waits here.
2. Check what was read from each picture (name, size, colour and so on) and correct anything wrong.
3. **Approve** it. The tile is added to your catalog and appears in the studio's tile strip; **Reject** a picture you do not want.

The Review tab. On a new account it says no tiles are waiting until you upload some.

After that

- **Tile sets** group tiles that go together (a base tile and its décor, for example).
- **Stock inventory** records what you have in stock.
- Your tiles can be browsed under **Catalog** → **Material** → **Tiles**, grouped by size, with filters for surface, colour, room and style.

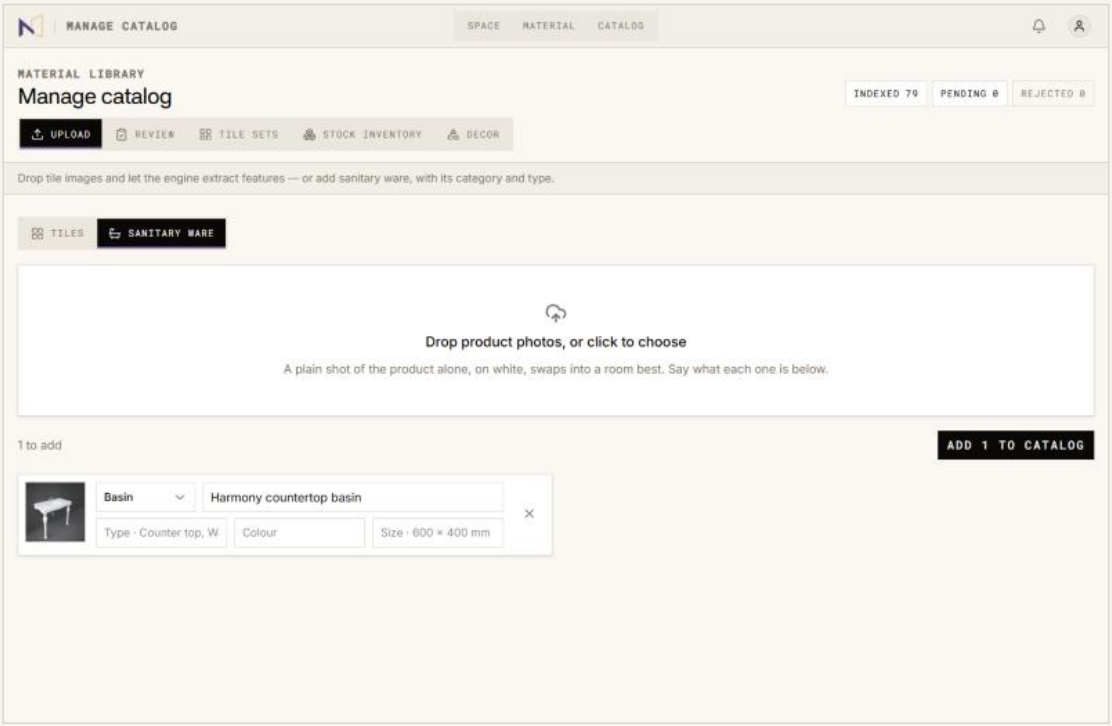

Catalog → Material → Tiles, once tiles have been added.

SECTION 4

Add sanitary ware (optional)

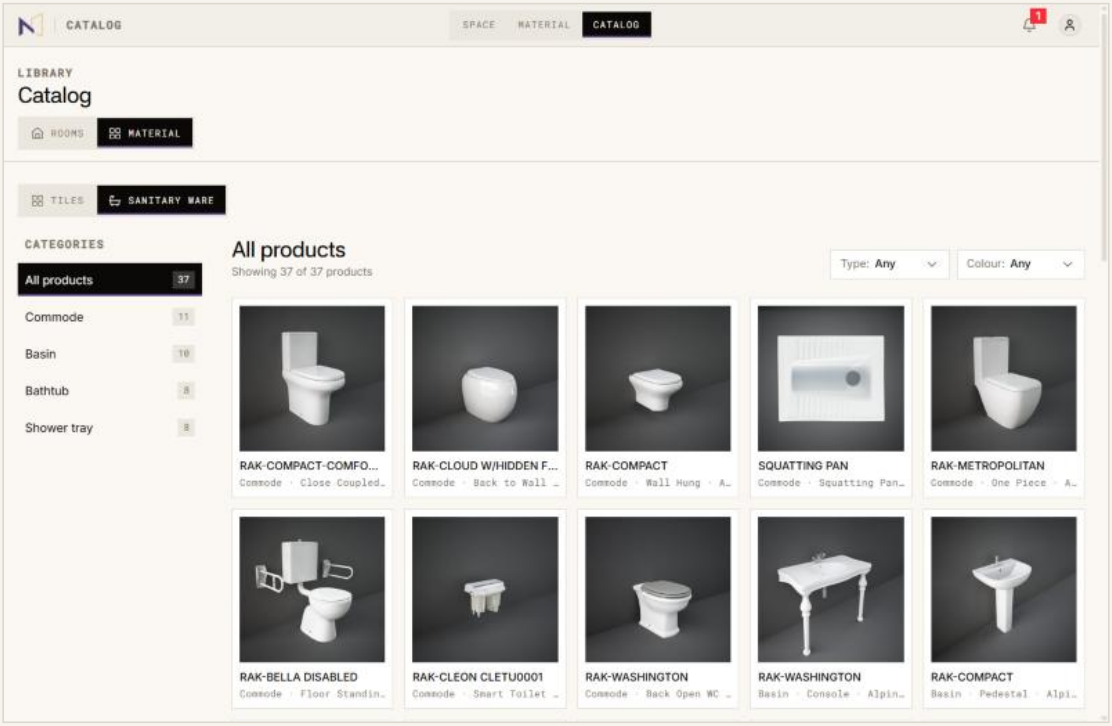

To swap a room's commodes, basins, baths, faucets and showers, add the products you sell.

1. In **Manage catalog → Upload**, switch to **Sanitary ware**.
2. Drop in product photos. A plain shot of the product alone, on white, swaps into a room best.
3. For each photo, choose the **category** (Commode, Basin, Bathtub, Shower tray, Faucet or Shower), check the **name** (taken from the file name) and add its **type** (for example *Wall hung* or *Counter top*), **colour** and **size**.
4. Press **Add … to catalog**. Products are added straight away; there is no review step.

Manage catalog → Upload → Sanitary ware: a basin photo, with its category, name, type, colour and size.

Your products then appear under **Catalog → Material → Sanitary ware**, by category, with filters for type and colour, and in the studio's sanitary strip (section 8).

Catalog → Material → Sanitary ware, once products have been added.

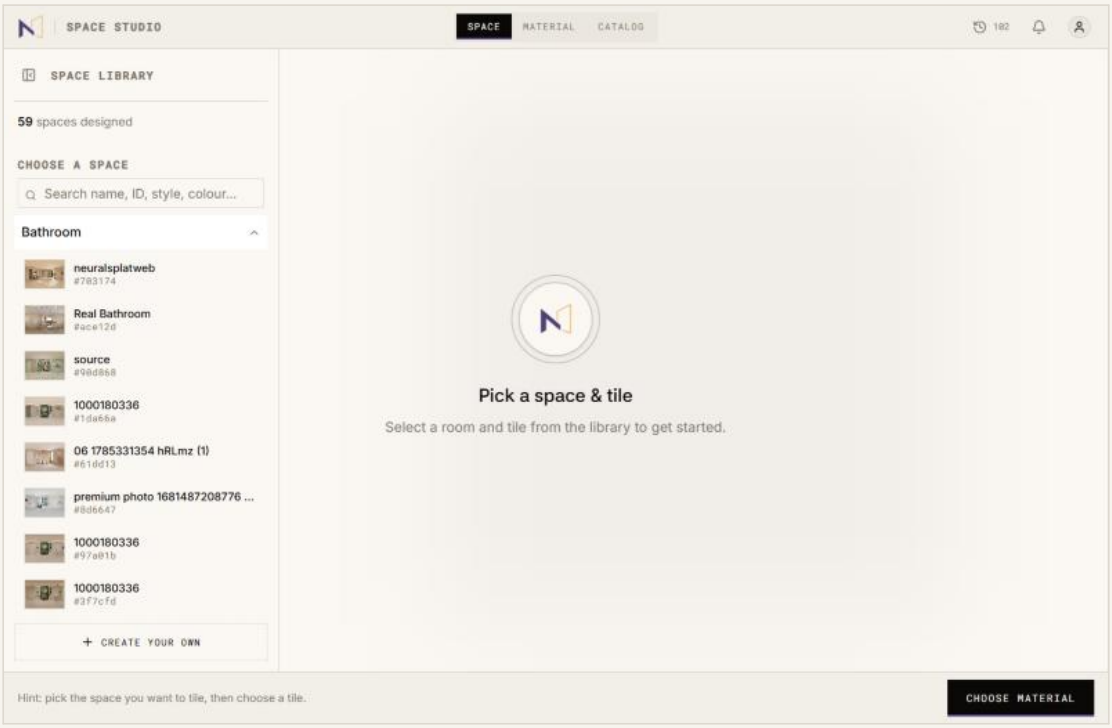

Tip. The **type** matters: it is how the studio knows a wall-hung commode cannot replace a floor-standing one, and only offers products that fit the fixture in the room.

SECTION 5

Open your space

With a space built and tiles in the catalog, you are ready to design.

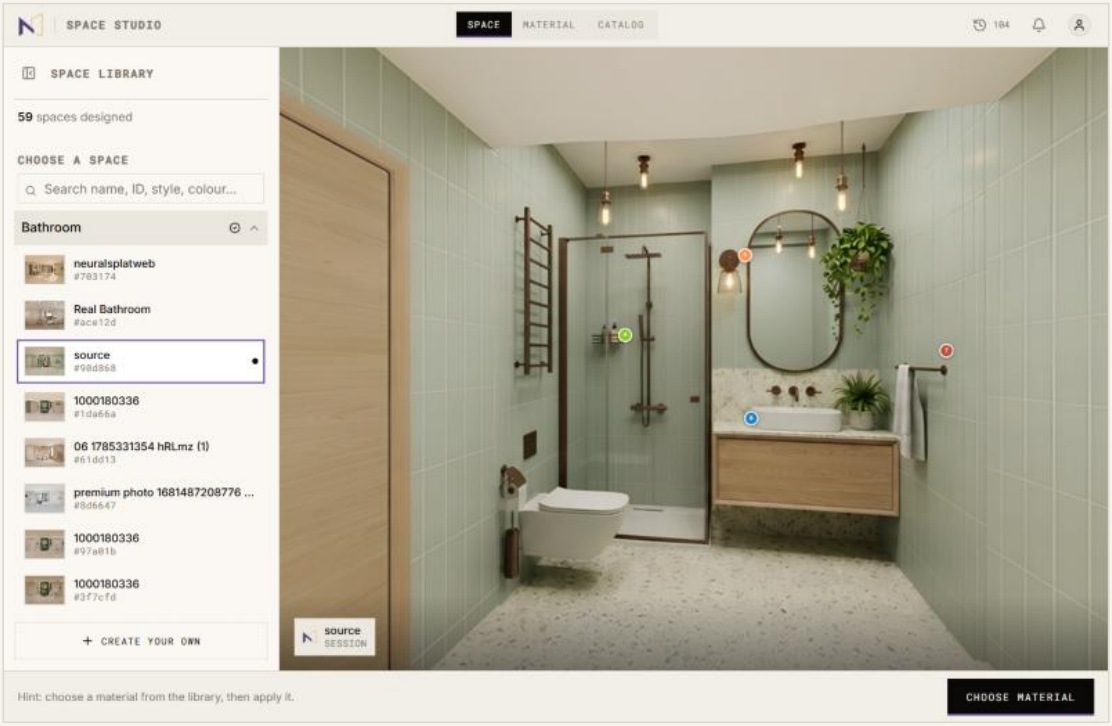

1. Click **Space** at the top.
2. In the **space library**, open the room type (Bathroom, Living Room…) or type the room's name in **Search**.
3. Click your space. It opens in the middle of the screen.

The space library with a category opened. Each space shows its name and ID.

Look around

- **Drag** with the mouse (or a finger) to turn and look in any direction.
- **Scroll** (or pinch) to zoom in and out.
- The **coloured numbered dots** mark the room's surfaces: the floor and each wall. You tap these to say where a tile goes.

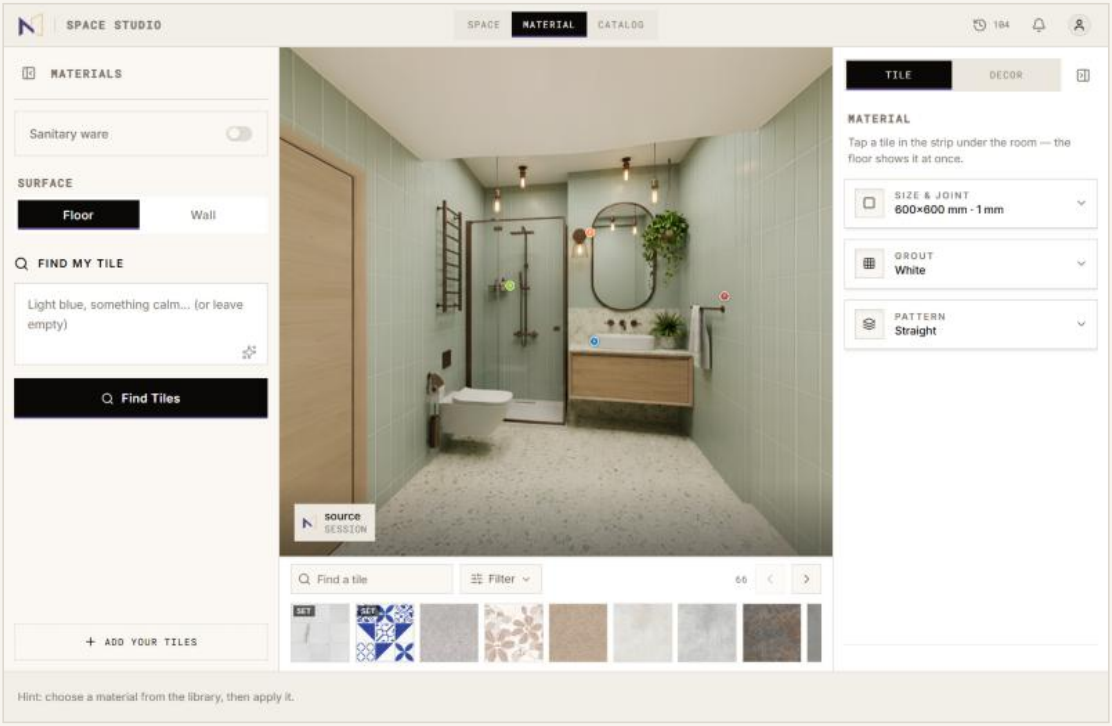

A bathroom space open in the studio. Each dot is a surface that can be tiled.

SECTION 6

Tile a surface

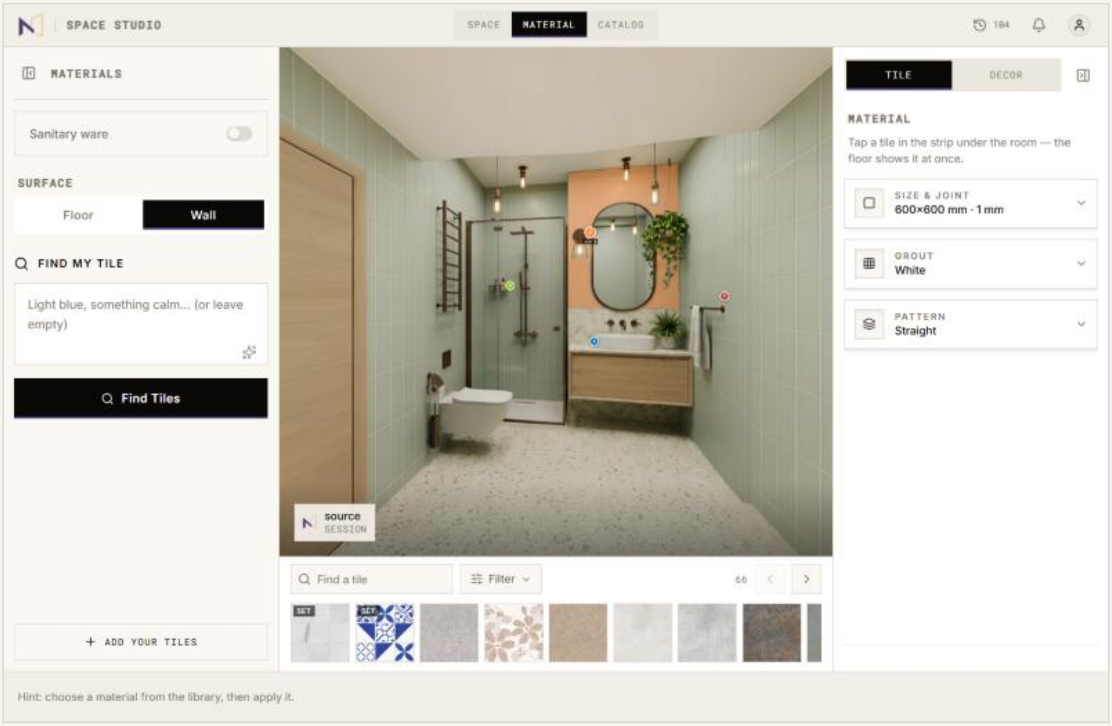

Pick a surface, tap a tile, and see it in the room at once. Keep it when you like it.

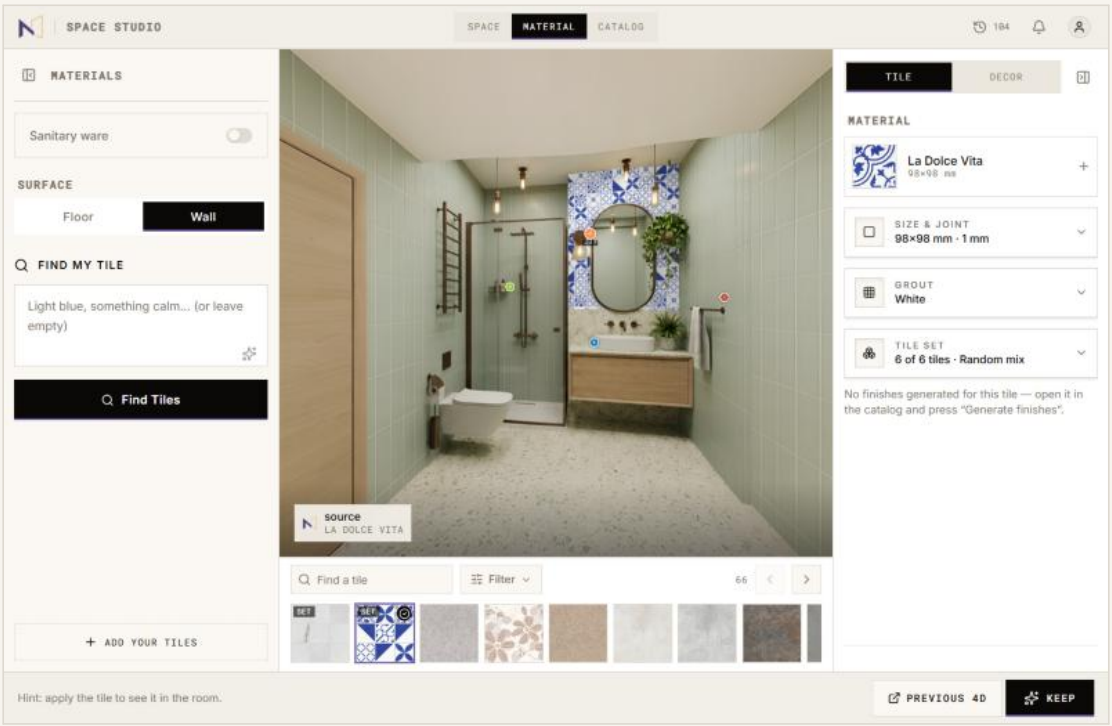

Material mode: surfaces on the left, the room in the middle, your tiles below it, tile settings on the right.

Step by step

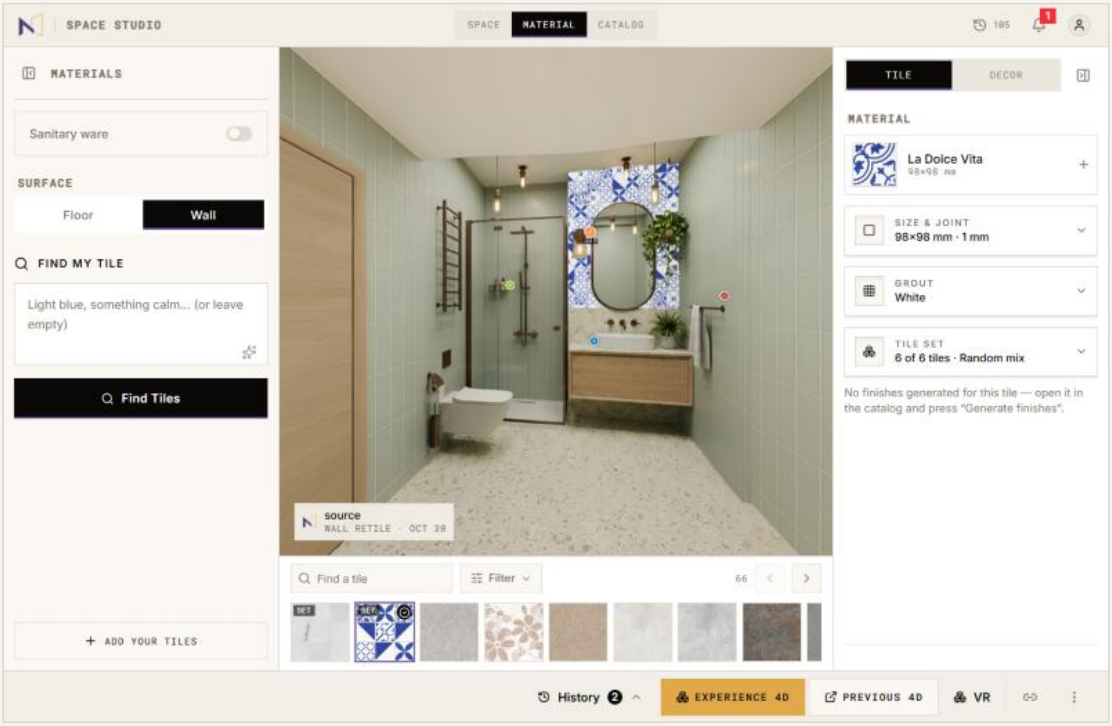

1. Click **Material** at the top (or **Choose material** in the bottom bar).
2. Under **Surface**, choose **Floor** or **Wall**.
3. For a wall, tap its **dot** in the room. The chosen surface is lit up so you can see exactly what will be tiled, and its dot shows a tick.
4. Tap a tile in the **strip under the room**. A quick preview appears on the surface straight away, so you can flick through tiles and compare.
5. When you like it, press **Keep** (bottom right). The tile is laid properly, at its real size, with grout and the room's own lighting, and a new version is saved.

The wall behind the basin chosen: the area to be tiled is highlighted.

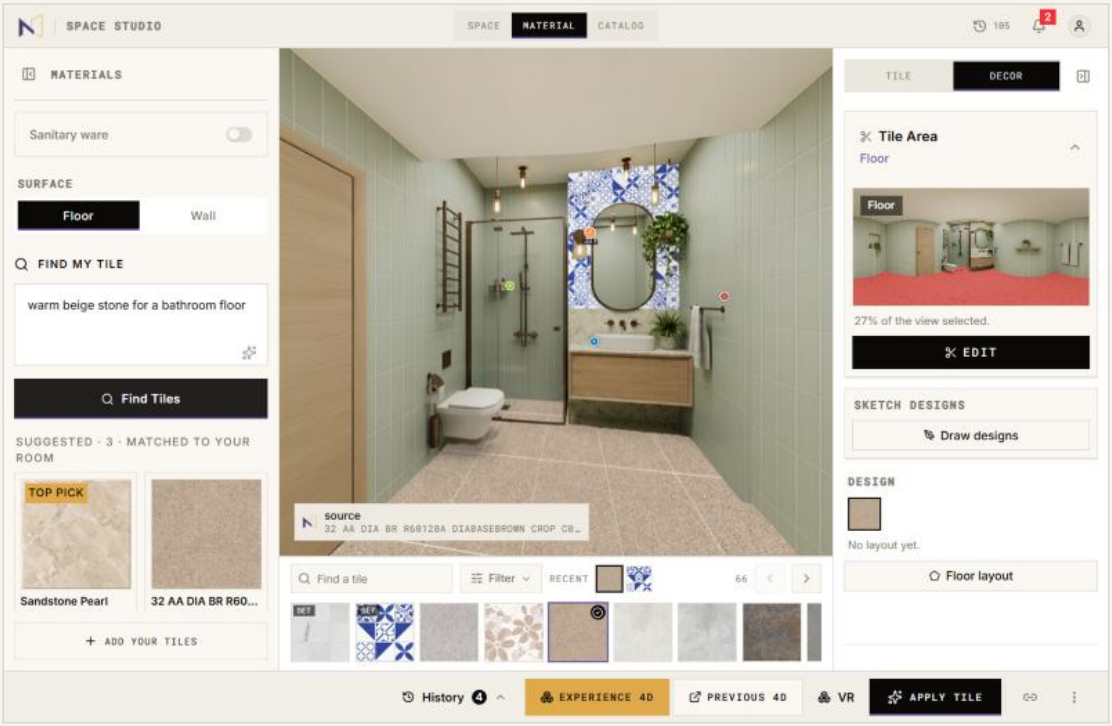

A patterned tile set tapped in the strip: a quick preview on the wall, and Keep in the corner.

After Keep: the set laid on the wall behind the basin. The bottom bar now holds History, Experience 4D, VR, sharing and the menu.

Finding the right tile

- **Find a tile** (above the strip) searches your tiles by name or code; **Filter** narrows them by size, colour, room or style; the arrows page through the strip.
- **Find my tile** (left panel) lets you describe what you want in plain words, such as *"warm beige stone for a bathroom floor"*, and suggests the best matches from your catalog, with a **Top pick**.

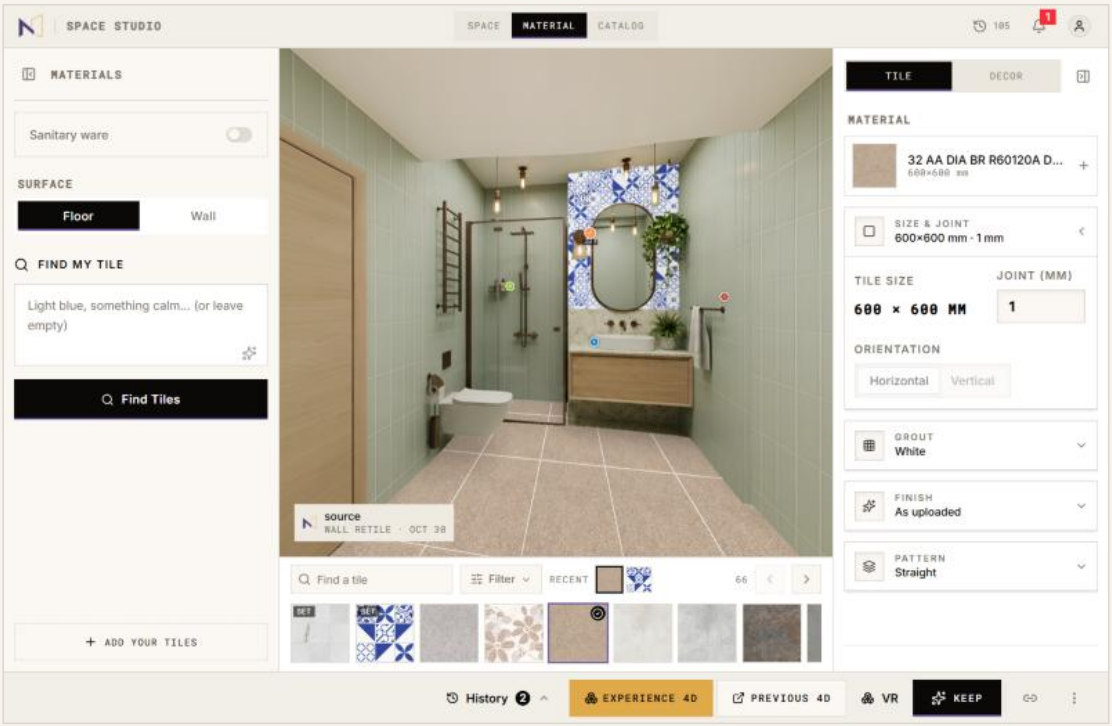

Find my tile: a description in plain words, and the suggestions below it.

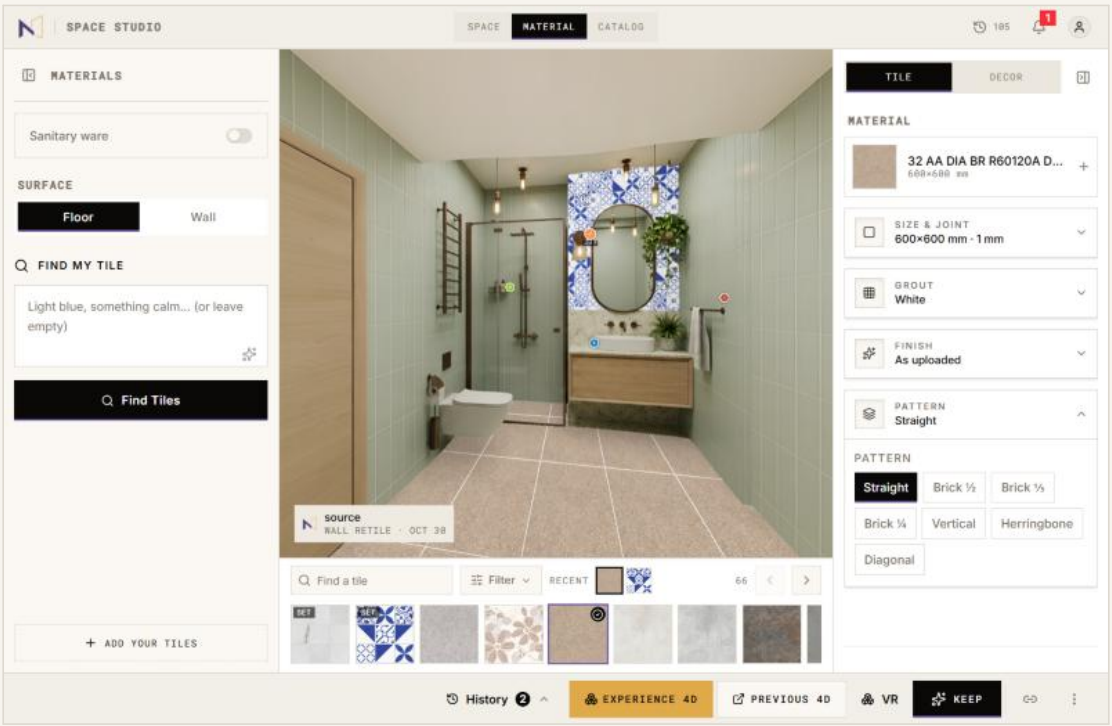

Size, grout, finish and pattern

The panel on the right controls how the chosen tile is laid. Change any of them and press **Keep** again.

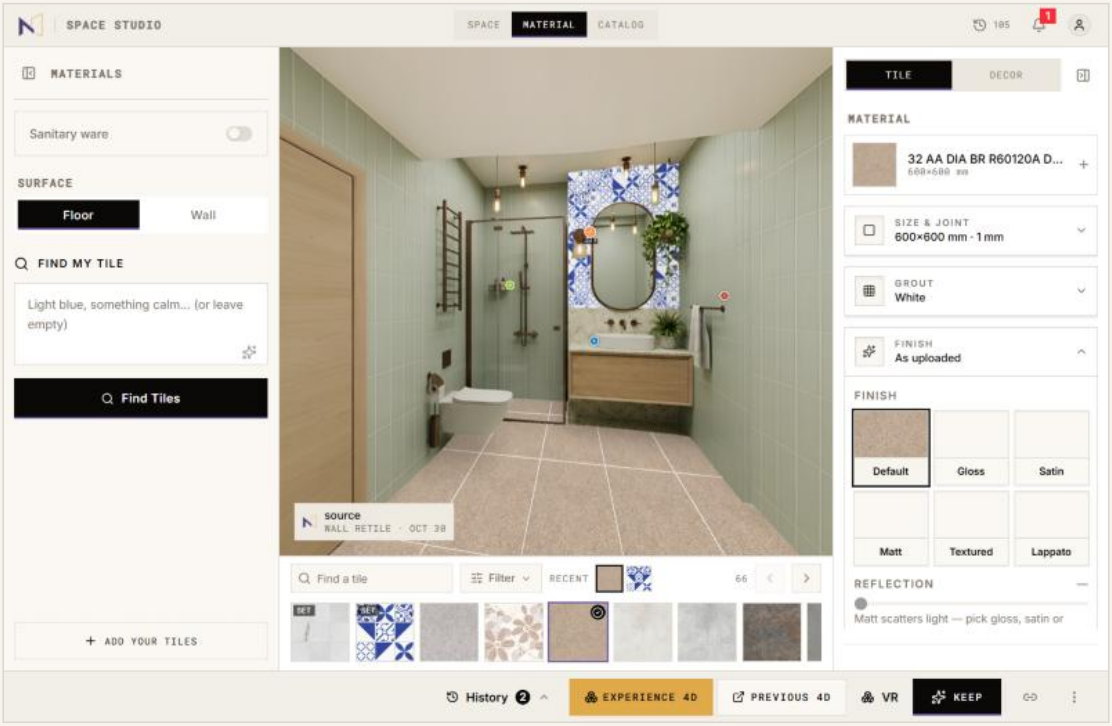

Size & joint	The tile's real size, the joint (grout line) width in millimetres, and whether long tiles run **horizontally** or **vertically**.
Grout	The grout colour, from white through greys to black and beige.
Finish	Default, Gloss, Satin, Matt, Textured or Lappato, with a **Reflection** slider.
Pattern	Straight, Brick ½, Brick ⅓, Brick ¼, Vertical, Herringbone or Diagonal.

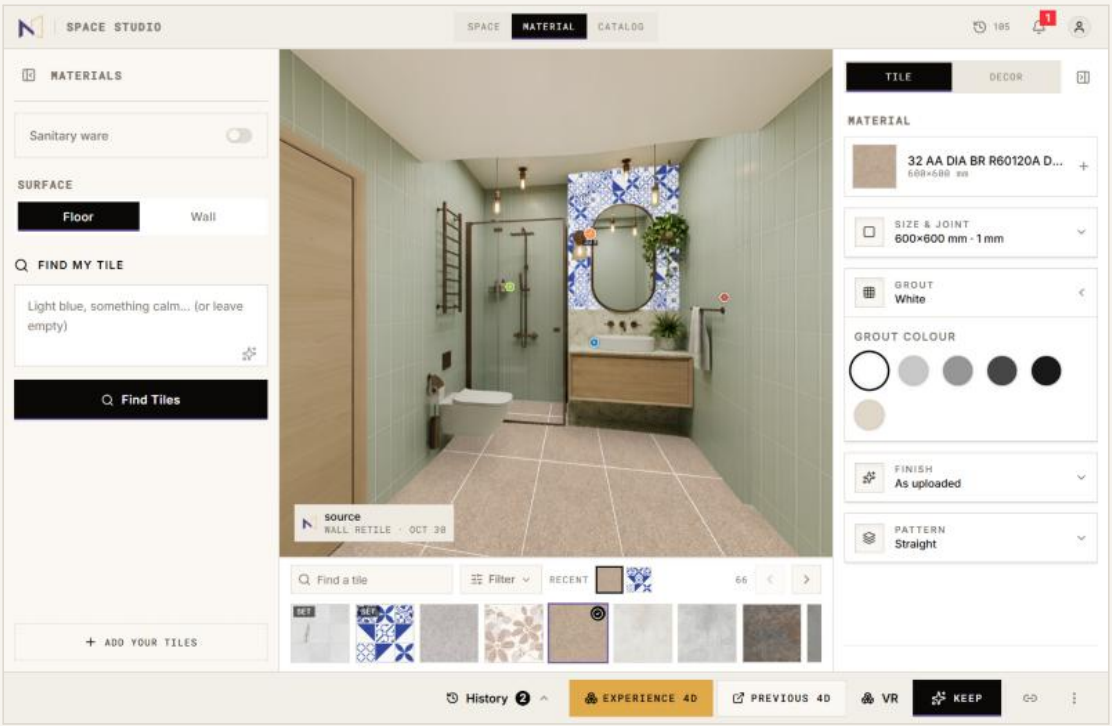

Size & joint, for a beige stone tile on the floor.

Pattern: how the floor tiles are set out.

Finish and Reflection.

Grout colour on the floor.

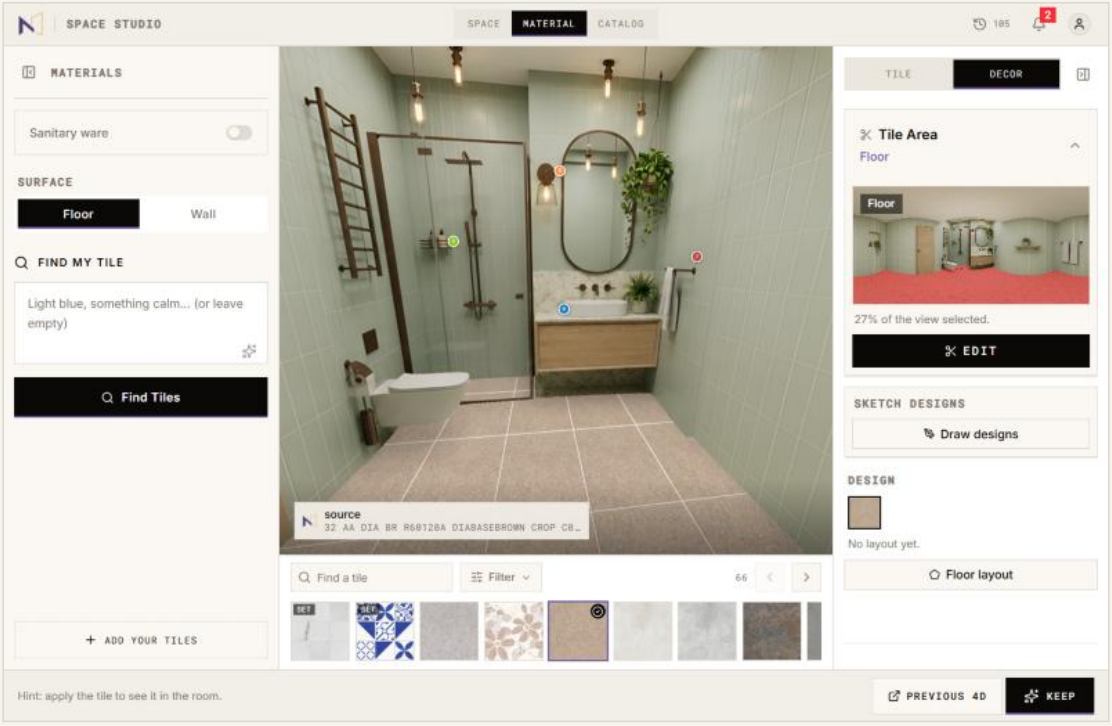

Tip. To change exactly where a tile goes, or to lay borders, bands and feature panels, use the **Decor** tab (section 7).

SECTION 7

Decor: where and how the tile goes

The Decor tab, next to Tile on the right, decides exactly which part of a surface is tiled, and lets you design it: feature panels, borders, bands and accent tiles.

The Decor tab has three parts, from top to bottom: **Tile area**, **Sketch designs** and **Design** (the floor or wall layout). Each works on the surface chosen under **Surface** on the left.

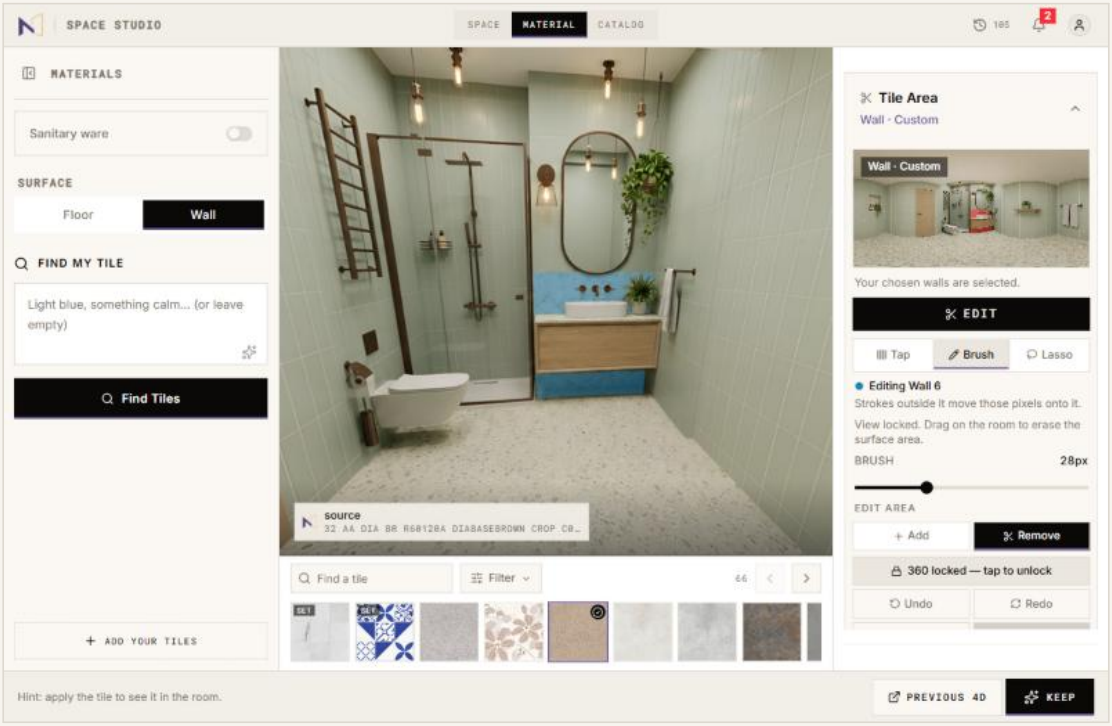

The Decor tab for the floor: the tile area is shown in red on the whole room.

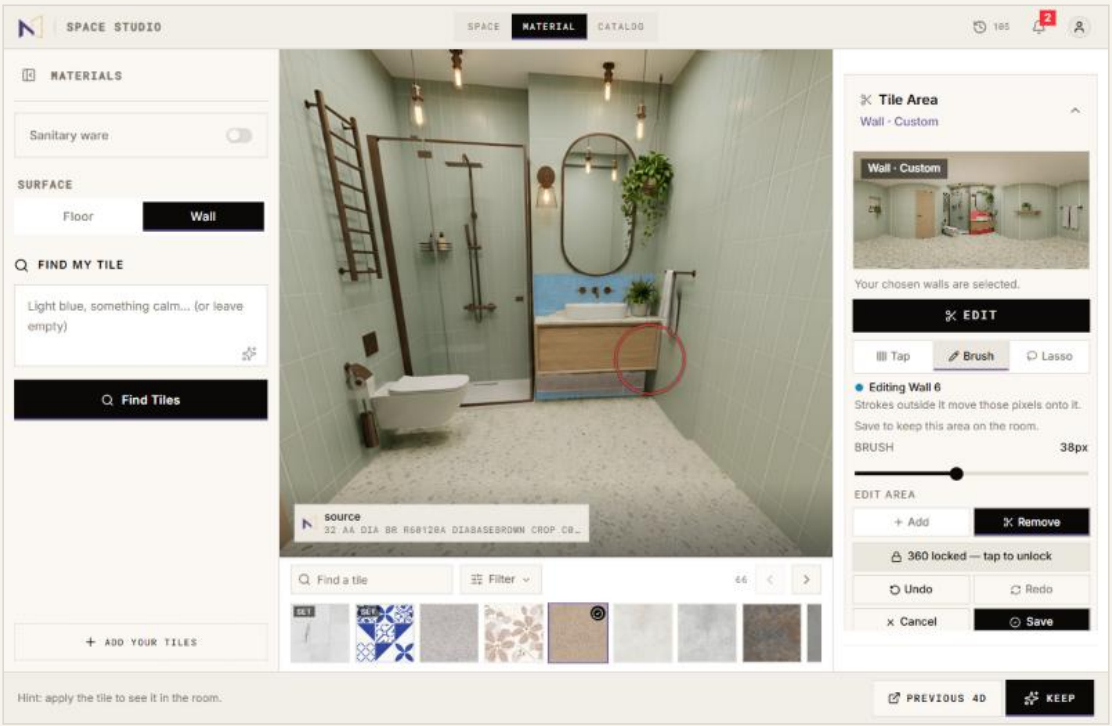

Tile area: add or remove area

When a space is created, its floor and walls are found automatically. Sometimes the area takes in something it should not, such as a cabinet, or misses a strip you want tiled. Tile area fixes that.

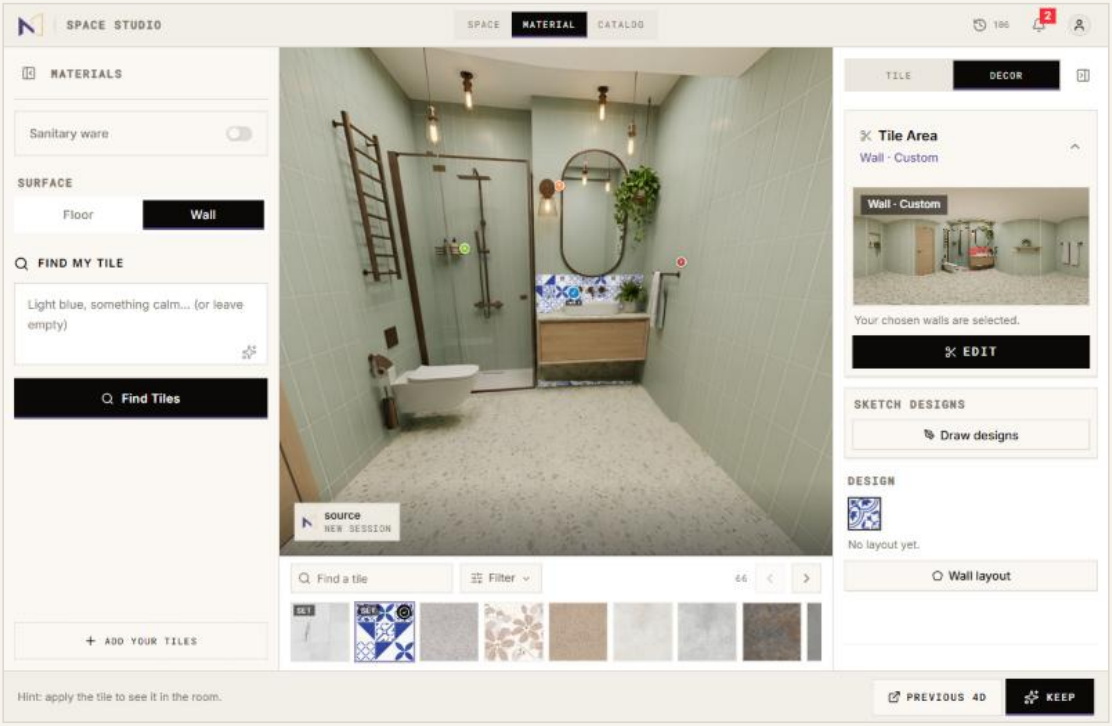

1. Choose **Floor** or **Wall** under **Surface**, open the **Decor** tab and press **Edit** under Tile Area.
2. Pick a tool: **Tap** adds or removes a whole region with one tap, **Brush** paints by hand (set its size with the slider), and **Lasso** draws round an area.
3. Choose **Add** or **Remove**.
4. Tap the **dot** of the surface you are editing. The room is locked in place so it cannot move while you mark it, and the area of that surface is shown in colour.
5. Paint, tap or draw on the room. **Undo** and **Redo** step through your strokes.
6. Press **Save**. **Cancel** leaves the area as it was.

Wall 6, behind the basin, picked: its area (blue) also covers the front of the vanity cabinet.

Brush and Remove: the cabinet is brushed out of the area. The splashback stays.

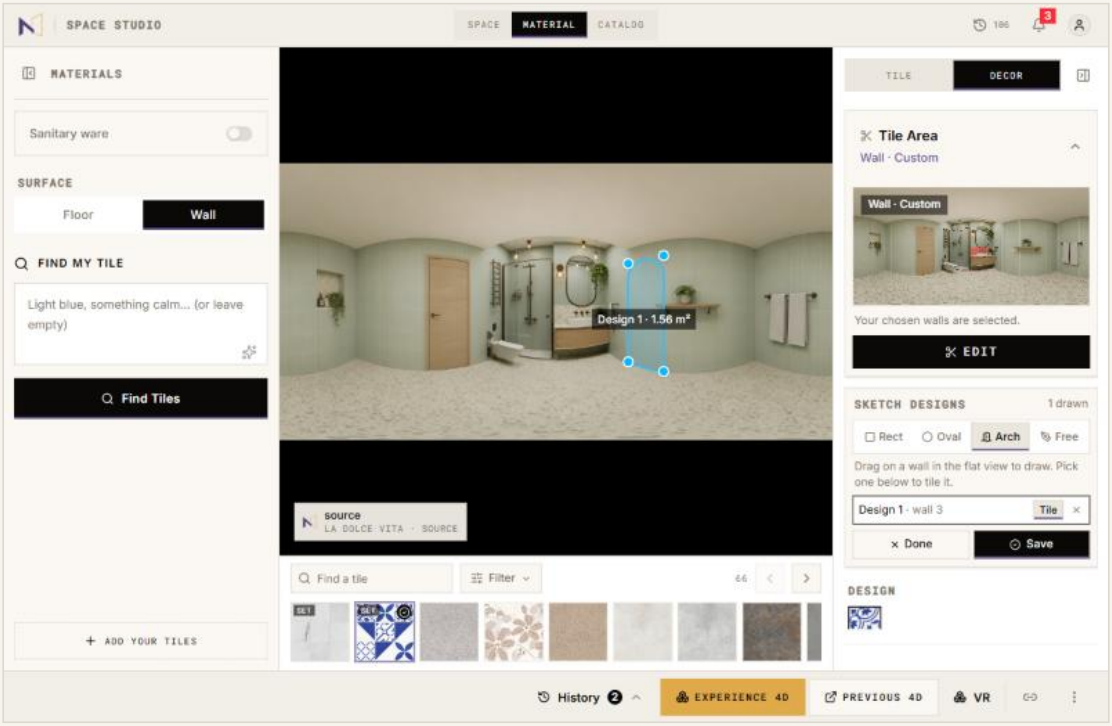

After Save, a tile on that wall goes on the splashback only, not on the cabinet.

> **Tip.** To look around while editing, tap **360 locked — tap to unlock**. Lock it again before you carry on marking, and pick the surface's dot again.

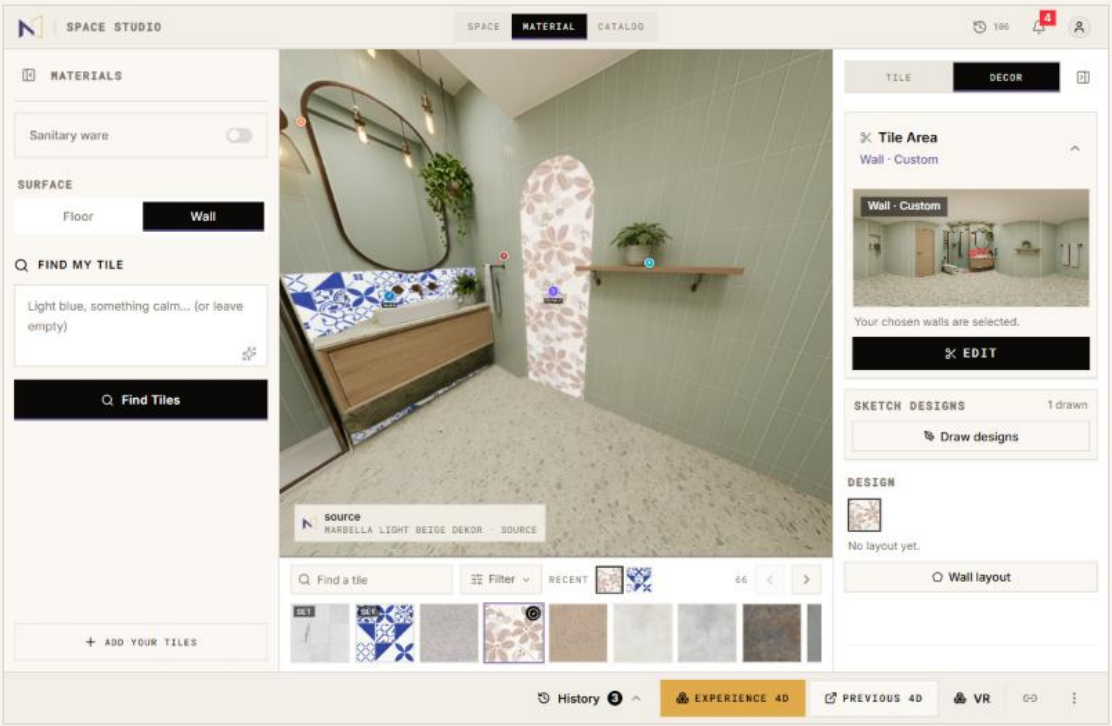

Sketch designs: a feature panel

Draw a shape on a wall, such as an arched panel beside a basin or a strip down a shower wall, and give it a tile of its own.

1. On the Decor tab, press **Draw designs**. The room opens out flat so the walls are easy to draw on. (This needs a room with at least one kept version: press **Keep** on any tile first.)
2. Pick a shape: **Rect**, **Oval**, **Arch** or **Free**, and drag it out on a wall. Its name, the wall it is on and its area are shown; drag the corner handles to adjust it.
3. In the list under the tools, press **Tile** next to the design you want to tile, then **Save**.
4. Choose a tile in the strip and press **Keep**. The tile is laid inside the design only.
5. × next to a design deletes it; **Done** closes the tools.

An arch drawn on wall 3 (1.56 m²), marked with Tile and ready to save.

After Keep: the floral tile laid inside the arch, beside the tiled splashback.

Floor layout and Wall layout

A layout sets out a surface with more than one tile: a border round the room, a rug-like panel in the middle, a decorative band (listello) along the walls, or a motif on every tile. The tile chosen in the strip is the **base tile**; every shape you draw gets a tile of its own.

1. Choose the surface and a base tile from the strip, open the **Decor** tab and press **Floor layout** (or **Wall layout**). The editor opens on the room's real plan, with each wall's length marked.
2. Pick a tool on the left and draw on the plan. The new shape appears under **Layers**.

3. With the shape selected, set its **tile**, how it is **laid**, its size and position, and the **grid turn** (0°, 45° or 90°).
4. Press **Done**, then **Keep** in the studio. The layout is laid in the room.

Floor layout on a new room: the plan to scale (7.07 m², four walls), the tools on the left.

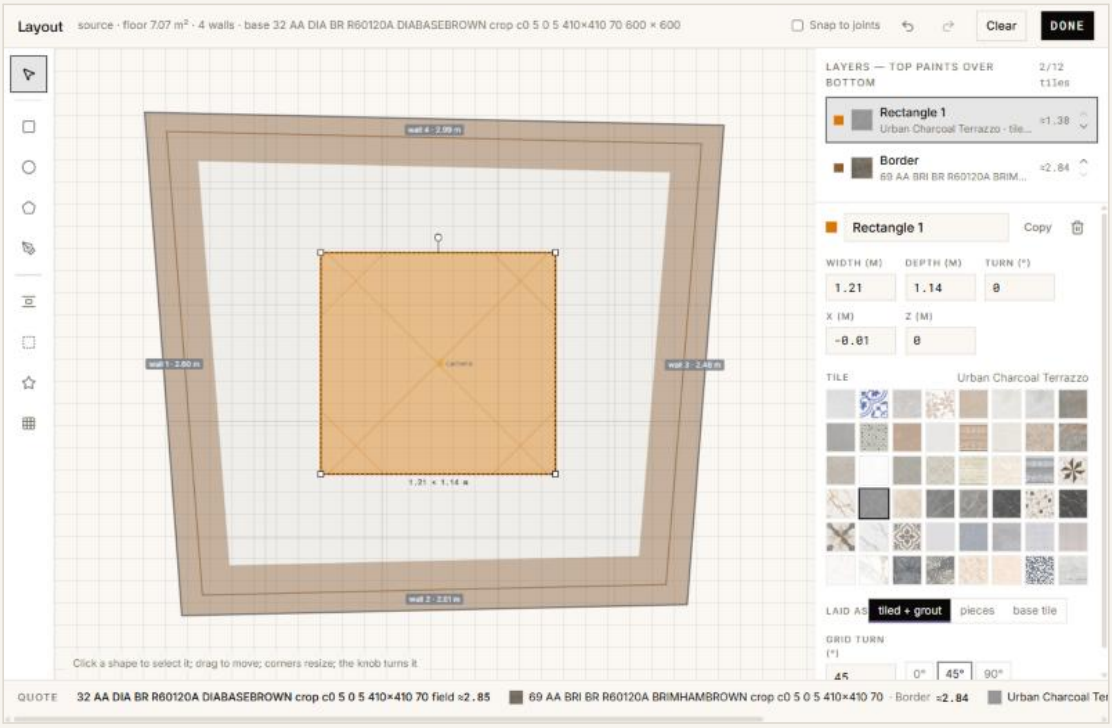

The tools

Rectangle, Ellipse	Drag out a panel. Set width, depth, turn and position in metres.
Polygon, Freehand	Click the corners (close on the first one, double-click or press Enter), or draw an outline by hand.
Band	On the floor, drag across the room; started near a wall it follows that wall. On a wall, drag along it for a course (listello) or up it for a stripe. Set its height, width and how many.
Border	Click once: a border follows the walls on the floor, or frames a wall. Set its margin and width.
Design	Lay a design from your library. New ones are traced from a picture on the Catalog page.
Repeat	A small motif (circle, square, diamond or hexagon) on every tile, on a checker, or every Nth tile.

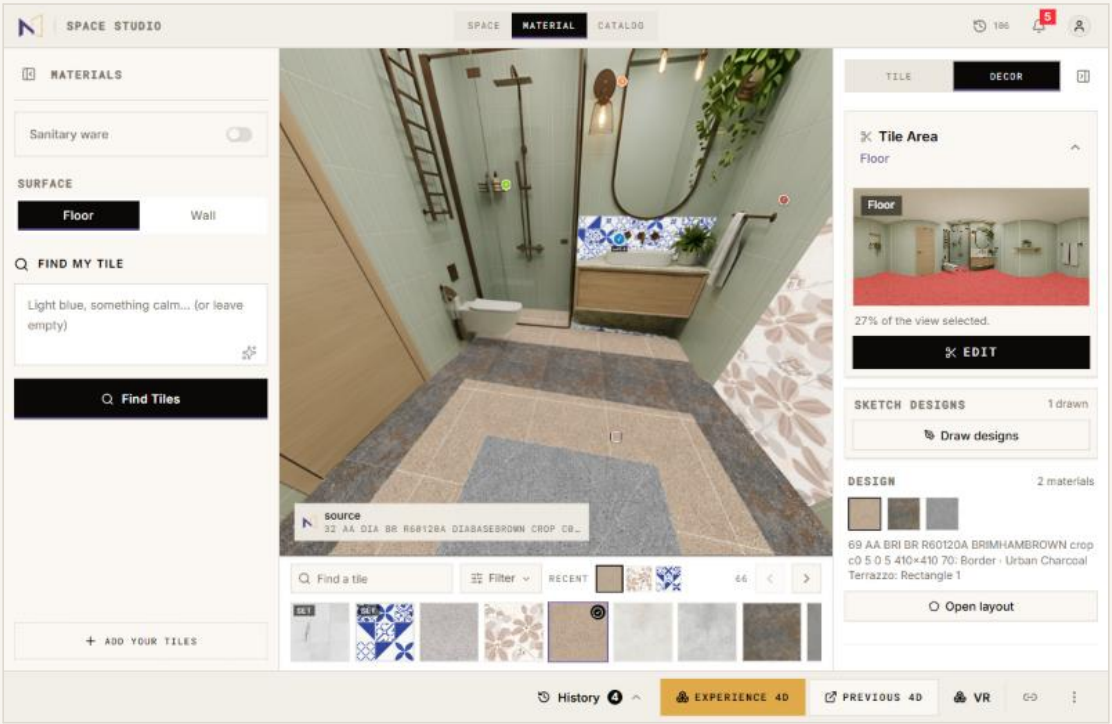

Shape settings

Laid as	**tiled + grout**: on its own grid with joints. **pieces**: groutless cut pieces, as for a listello. **base tile**: a hole that shows the surface's own tile.
Layers	Top paints over bottom; the arrows reorder them. **Copy** duplicates a shape and the bin removes it.
Wall layouts	Choose the wall at the top. A shape can sit on that wall only or on **every wall**.

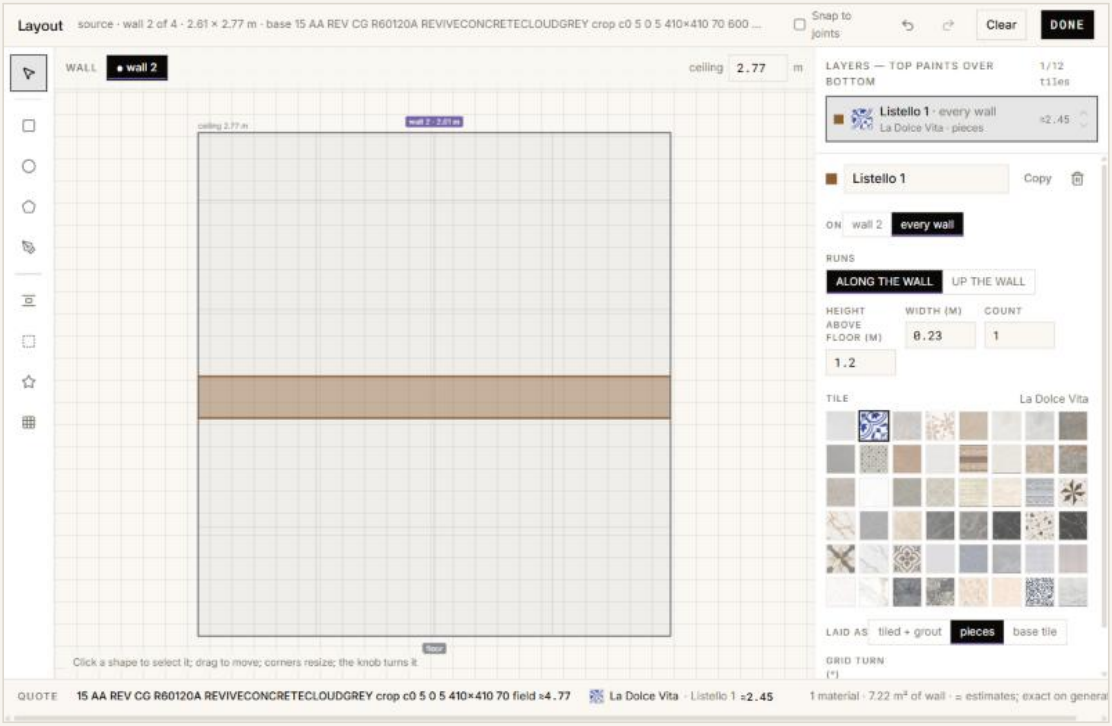

Snap to joints	Edges jump to the nearest grout line, so fewer tiles are cut.
Quote	The bar at the bottom lists each tile and its area as you draw, for an estimate before you lay it.

A dark border round the room and a grey panel in the middle laid at 45°. The quote bar shows each tile's area.

After Done and Keep: the border, the beige field and the diagonal panel in the room.

Wall layout: a patterned listello 1.2 m above the floor, running round every wall.

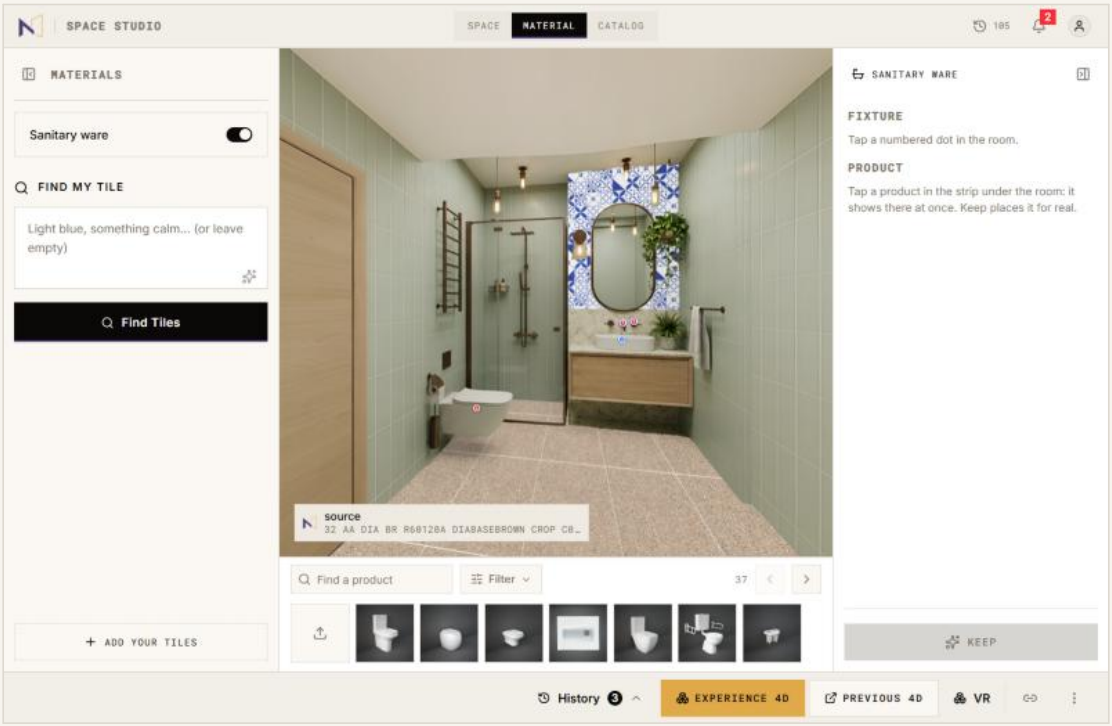

Tip. The **Design** row on the Decor tab shows the base tile and every tile in the layout. **Open layout** takes you back to edit it.

SECTION 8

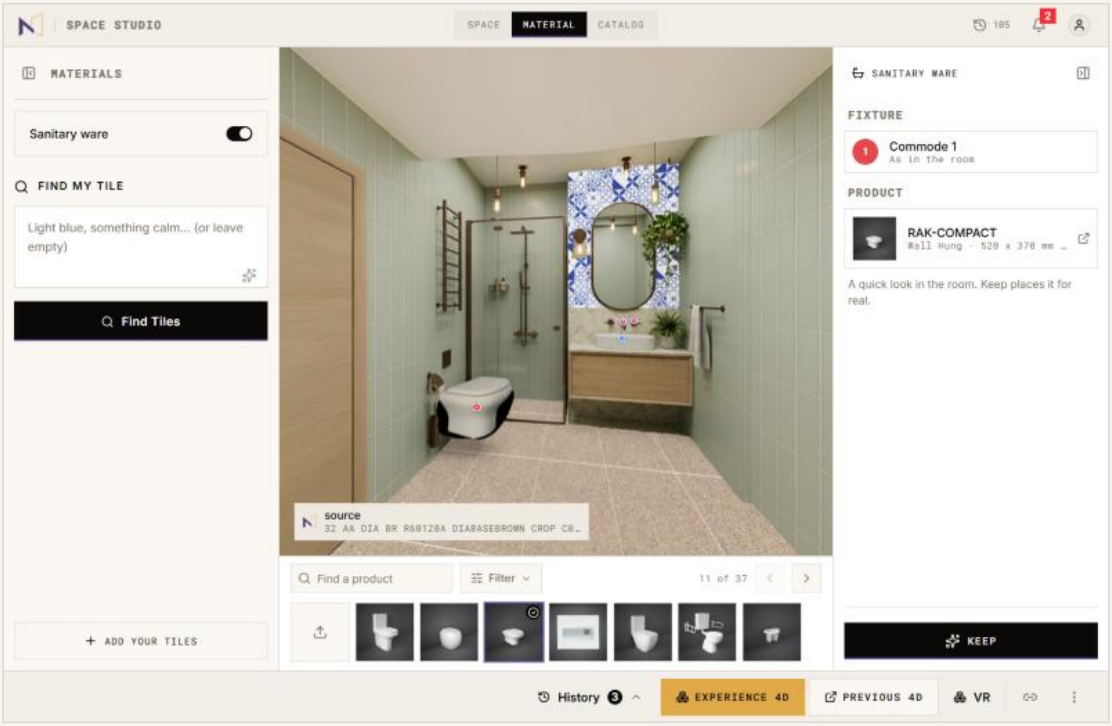

Swap sanitary ware

Replace the room's fixtures with products from your catalog (section 4).

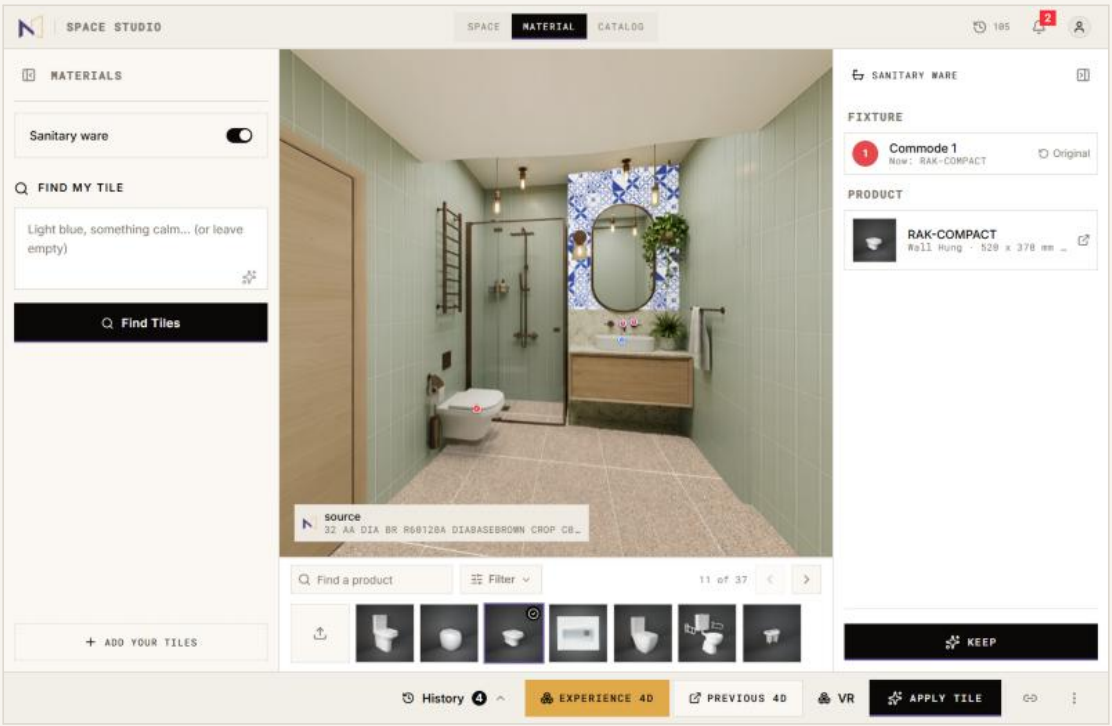

1. In Material mode, turn on **Sanitary ware** (top of the left panel). The fixtures in the room are found and marked with numbered dots, and the strip under the room shows your products.
2. Tap a fixture's **dot**. The panel on the right names it.
3. Tap a **product** in the strip. A quick look shows it in place straight away. Products that do not fit the fixture are greyed out.
4. Press **Keep** to put it in the room for real. This takes a few seconds.

Sanitary ware on: fixtures marked in the room, products in the strip.

Commode 1 picked, with RAK-COMPACT shown on it as a quick look before Keep.

After Keep: the RAK-COMPACT commode in the room.

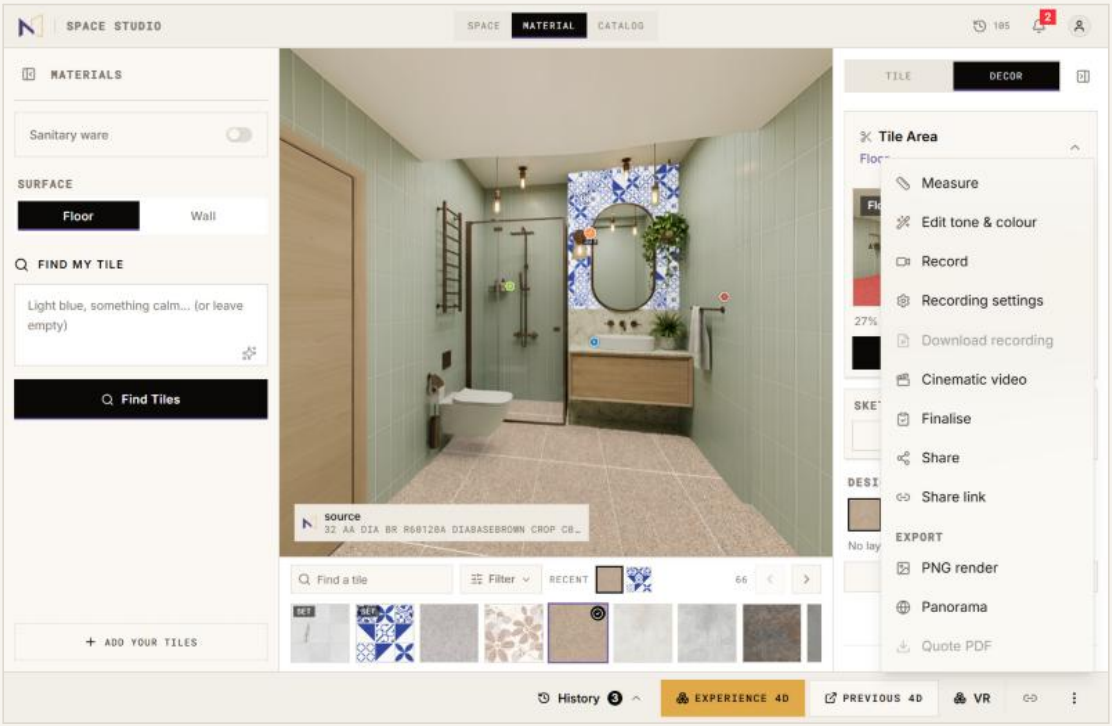

Tip. **Original**, next to the fixture's name, puts the room's own fixture back. A product not in your catalog can still be tried: the upload button at the start of the strip takes a photo of it.

SECTION 9

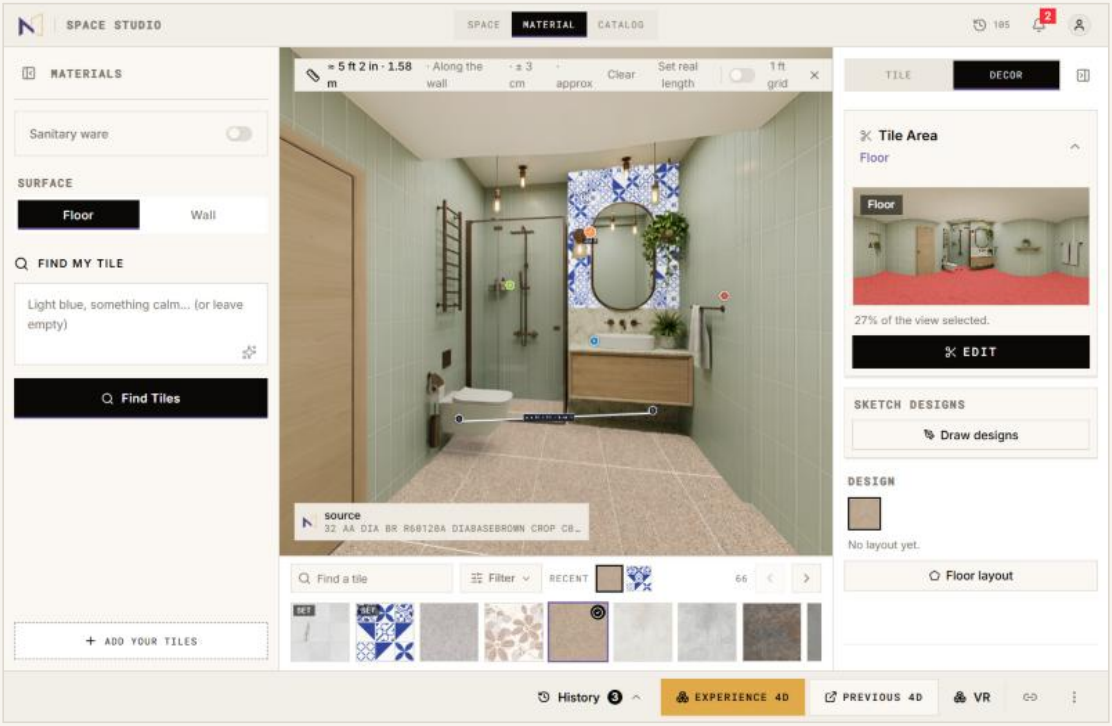

Measure the room

A measuring tape for the 360 view: tap two points on the floor or a wall and read the distance.

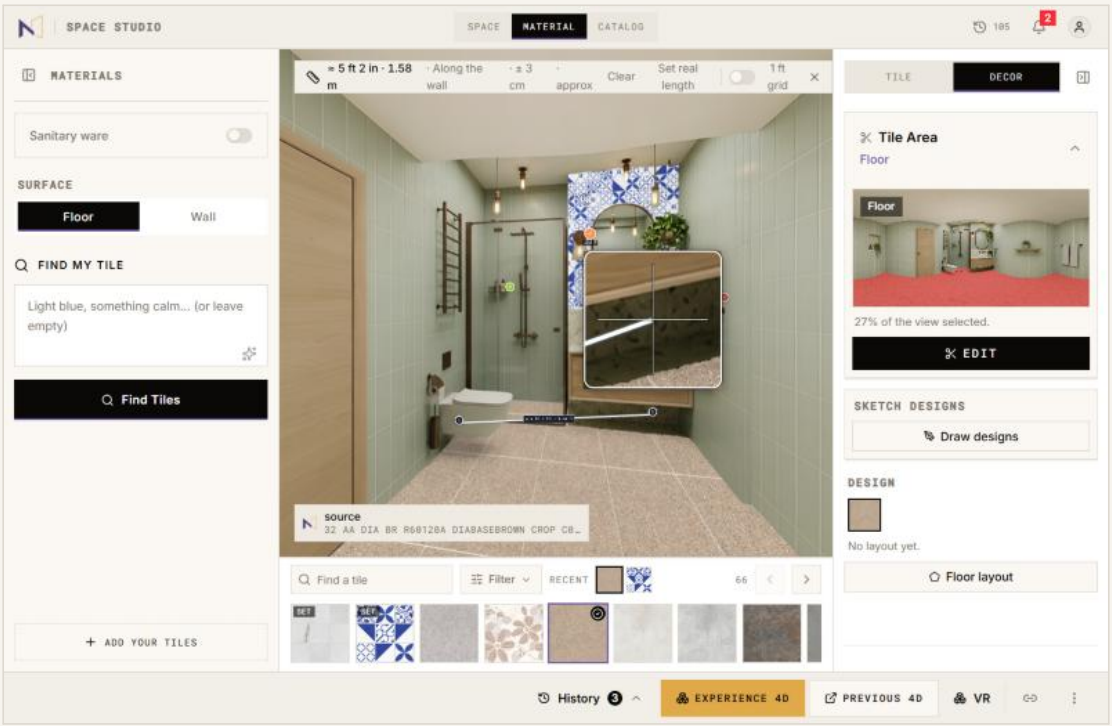

1. Open the **three-dot menu** at the right of the bottom bar and choose **Measure**.
2. Tap the first point, then the second. A **magnifier** shows exactly where each point will land; points near a corner or the floor line snap onto it.
3. Read the result at the top left: feet and inches, metres, what was measured and how precise it is (±).
4. Drag either end to adjust it. A third tap starts a new measurement; **Clear** removes it; **×** puts the tape away.

The three-dot menu. Measure is at the top.

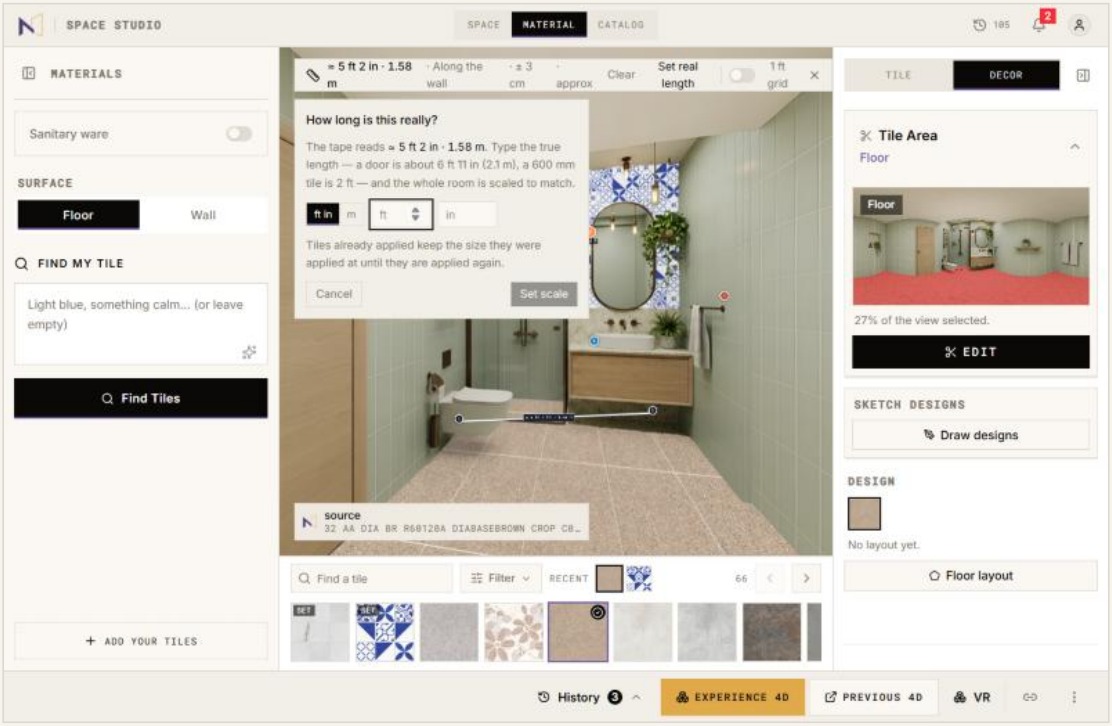

A length measured along the wall: about 5 ft 2 in.

The magnifier while placing a point.

Readings say **approx** until the room's real size is known. Set it with **Set size** in the Catalog (section 2), or here: measure something whose size you know, such as a door (about 2.1 m) or a 600 mm tile, press **Set real length**, type its true length and **Set scale**. The whole room is rescaled to match.

Set real length.

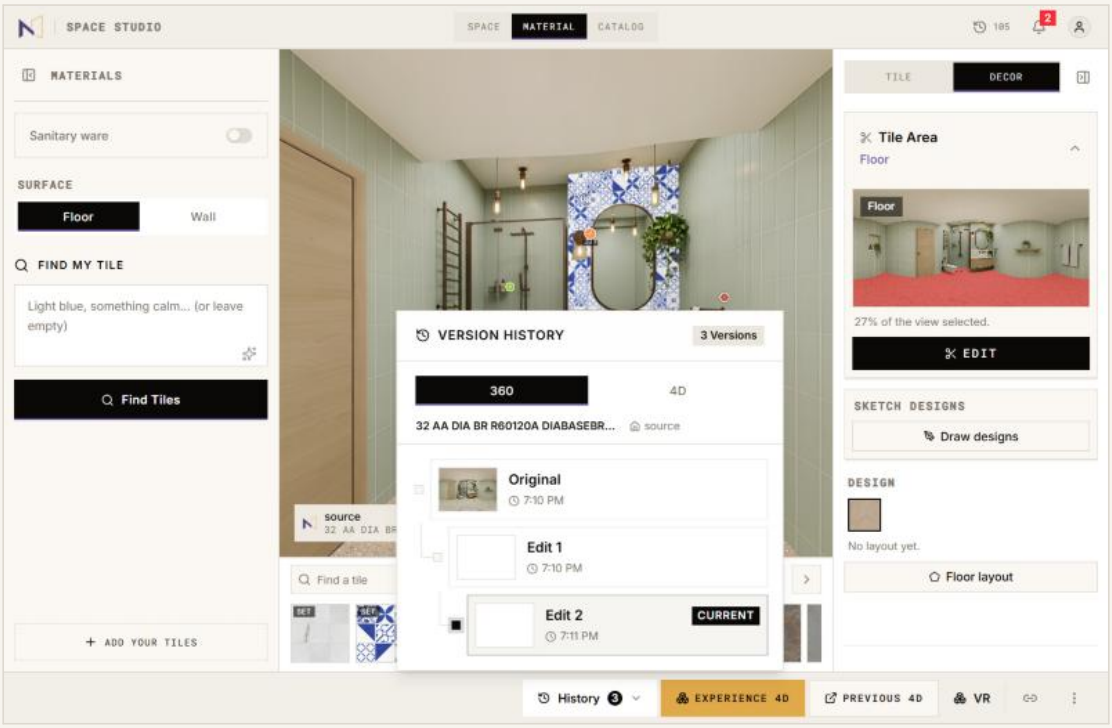

> **Tip.** Turn on **1 ft grid** in the reading to lay one-foot squares over the chosen surface.

SECTION 10

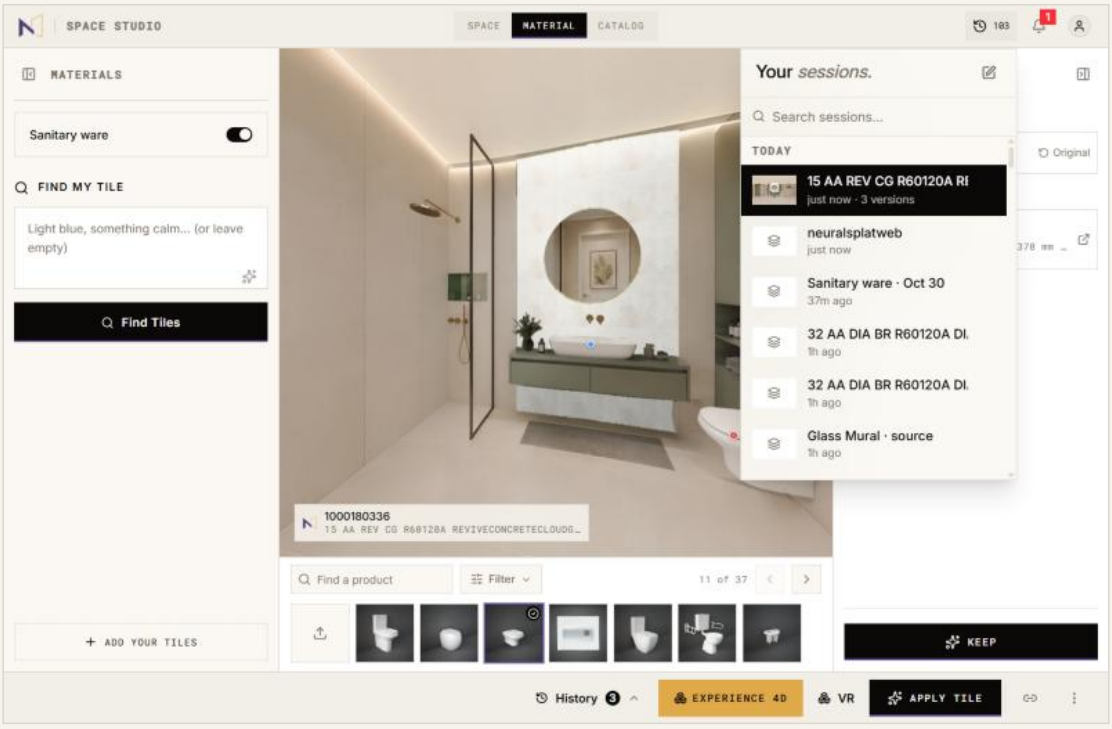

Versions and sessions

Nothing is lost: every Keep is a version, and every room you work on is a session.

Press **History** in the bottom bar to see every version of the room, from the **Original** onwards; click one to go back to it. The **clock icon** at the top lists your sessions, newest first, with a search box.

Version history: the original and the edits made to it.

Your sessions.

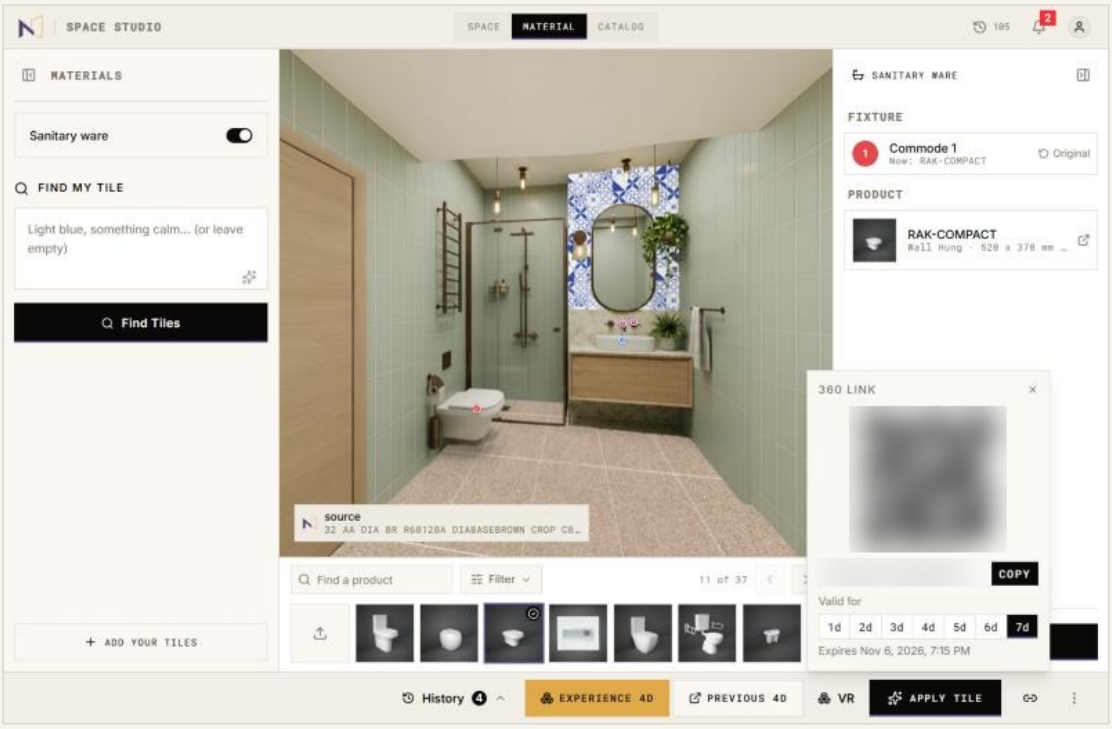

SECTION 11

Share and present

Send the design to a customer, show it in a headset, or take pictures and video away.

A link for your customer

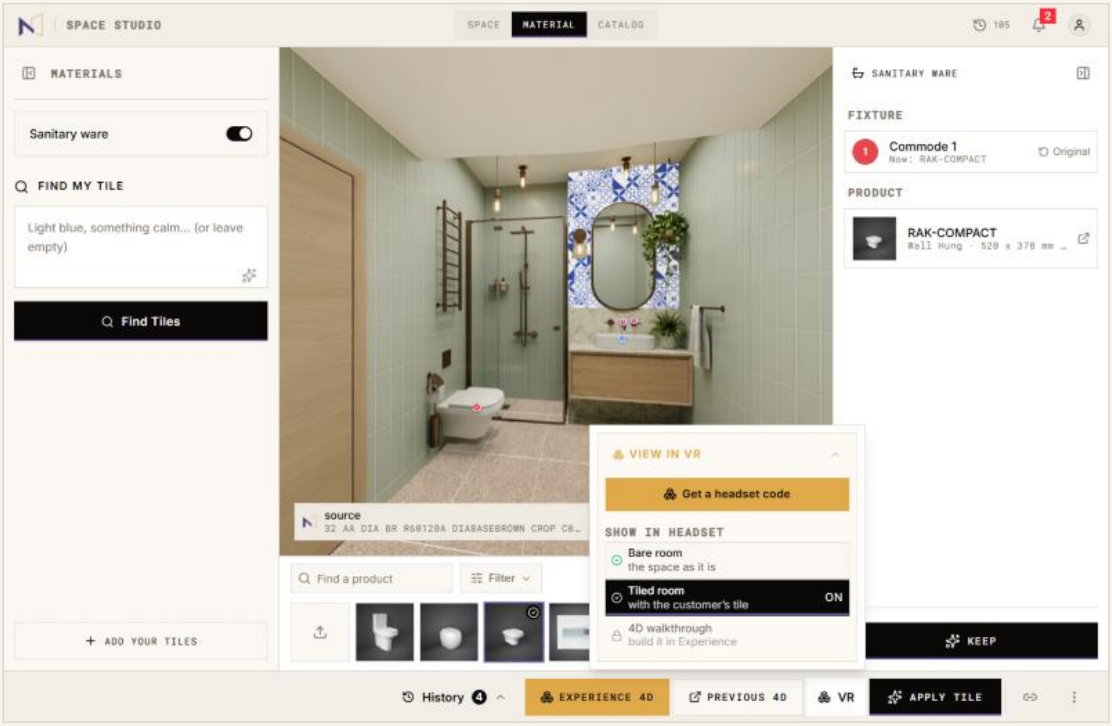

Press the **link icon** in the bottom bar for a **QR code** and a link to the 360 view that anyone can open, with no sign-in. Choose how long it stays valid (1 to 7 days) and press **Copy**.

The 360 link. (Blurred here.)

Virtual reality

Press **VR**, then **Get a headset code**, and type the code into the headset's browser. Choose what it shows: the bare room, the tiled room, or a 4D walkthrough once one exists.

View in VR.

More in the three-dot menu

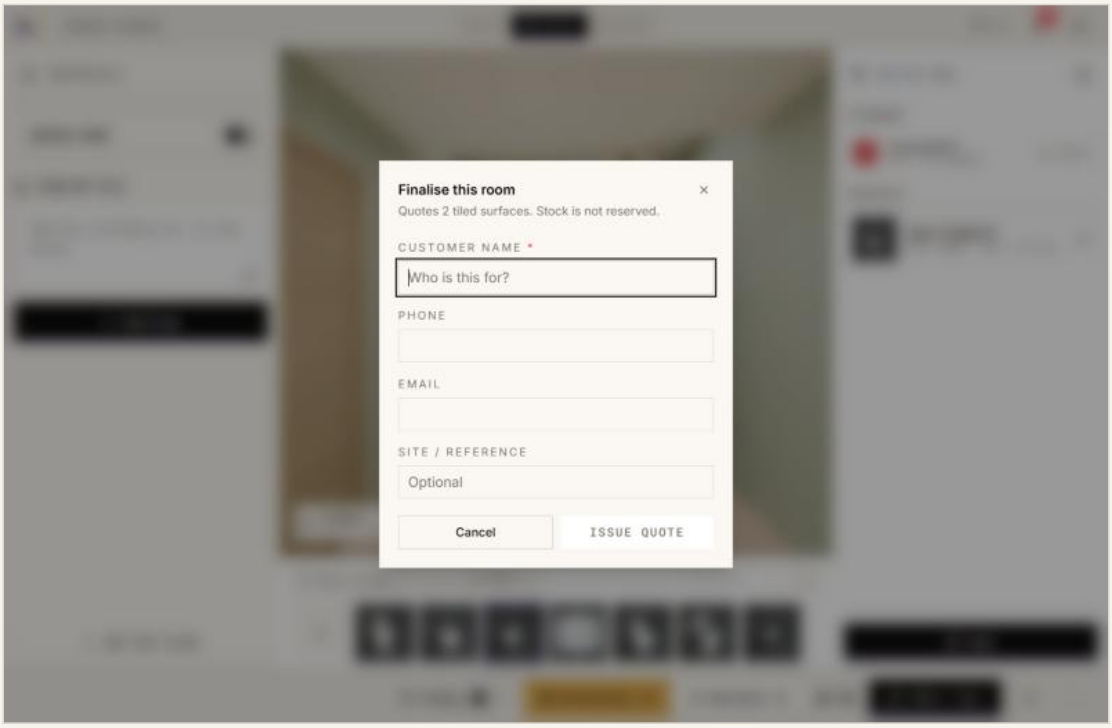

Experience 4D	The gold button builds a walkable 3D version of the room (a few minutes).
Edit tone & colour	Adjust the overall look of the image.
Record	Record a tour of the 360 view; **Recording settings** and **Download recording** go with it.
Cinematic video	A smooth, ready-made video of the room.
PNG render · Panorama	Download the current view, or the whole 360 panorama.
Quote PDF	Download the customer's quote, once the room is finalised.

SECTION 12

Finalise and quote

When the customer is happy, turn the design into a quote.

1. Make sure the room's real size is set (section 2).
2. Open the **three-dot menu** and choose **Finalise**.
3. Enter the **customer's name** (required), and their phone, email and site or reference if you have them, then press **Issue quote**.
4. Download it with **Quote PDF** in the three-dot menu. It lists every tiled surface, its area and the tiles needed.

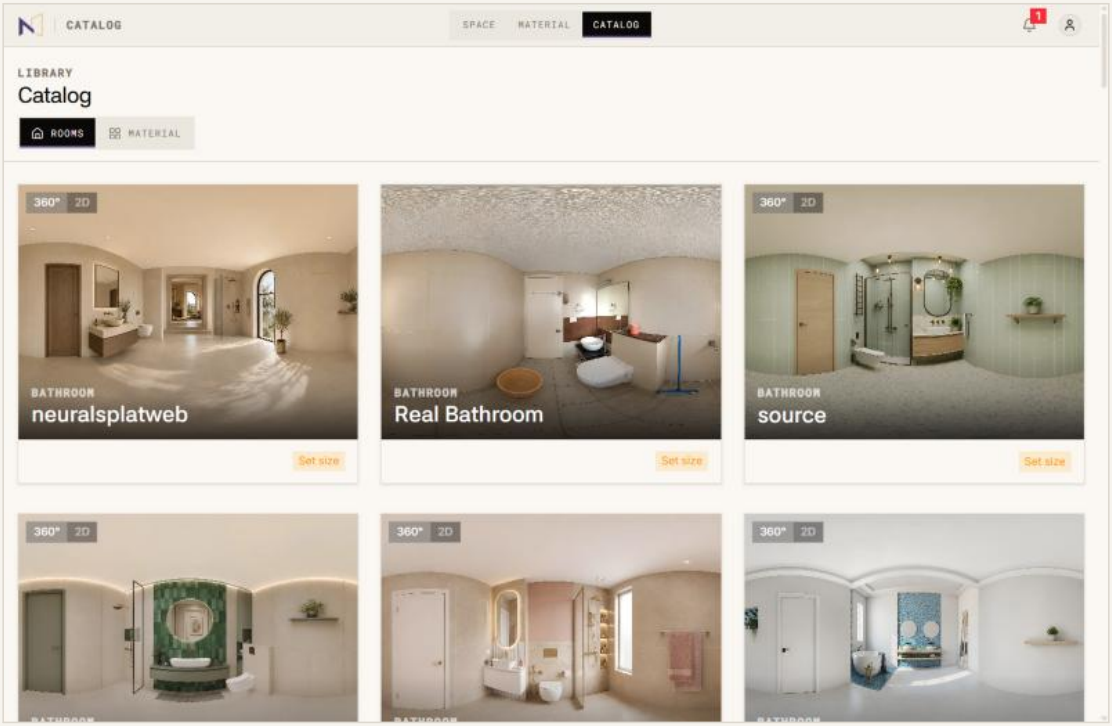

Finalise this room.

SECTION 13

The catalog

Everything your company has, in one place: spaces, tiles and sanitary ware.

Click **Catalog** at the top. **Rooms** shows every space as a card; switch a card between its **360°** view and the original **2D** photo, and use **Set size** to give it its real size. **Material** has a **Tiles | Sanitary ware** switch for browsing your products.

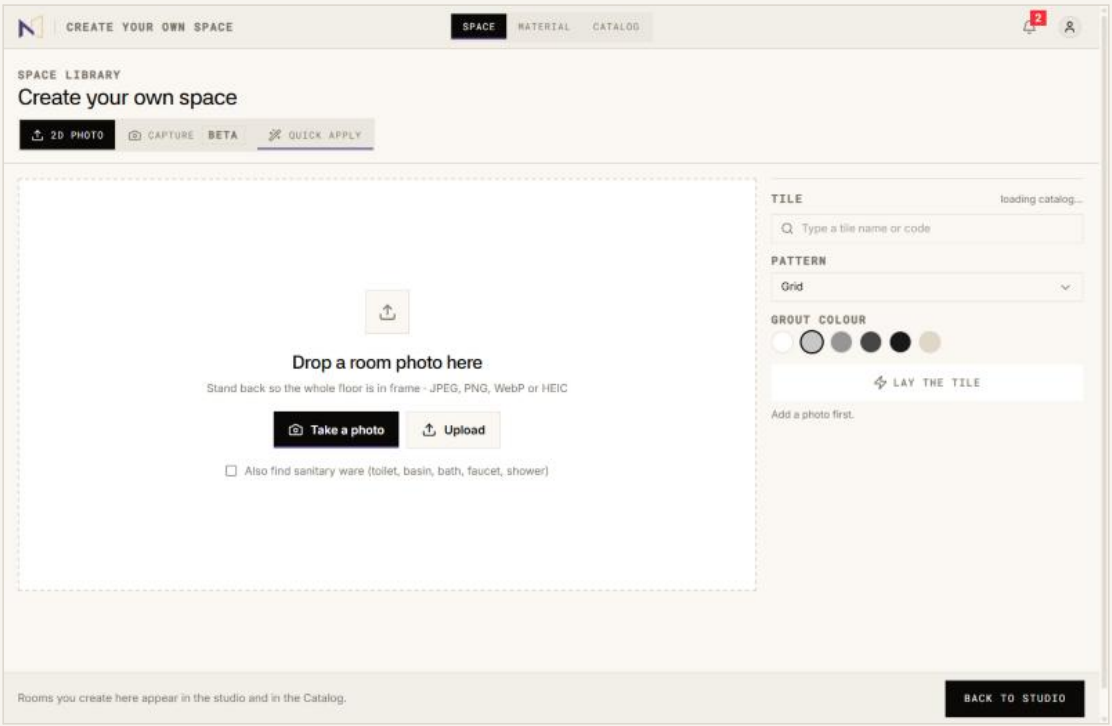

Catalog → Rooms.

SECTION 14

Quick apply

A tile, or a new commode, on any photo of a room, in seconds, with no space to build first.

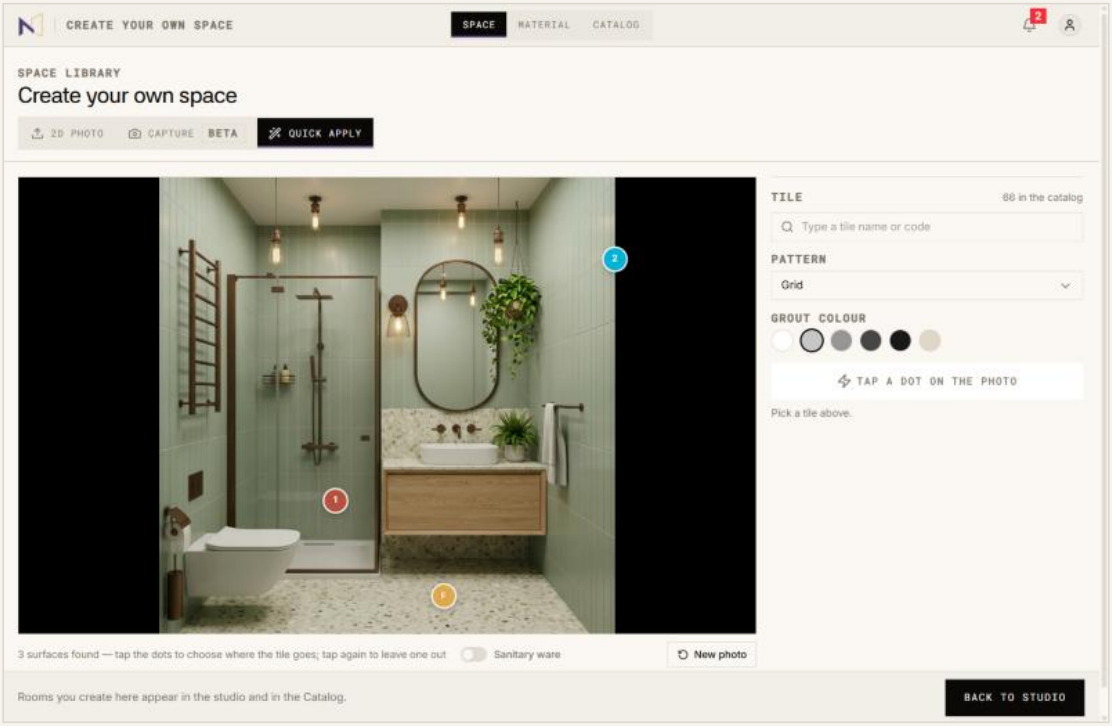

1. Open **Create your own** → **Quick apply**.
2. Press **Take a photo** to use your camera, or **Upload** one (JPEG, PNG, WebP or HEIC). Tick **Also find sanitary ware** first if you want to swap fixtures too.
3. The photo is read and a coloured dot appears on the floor (**F**) and on each wall.

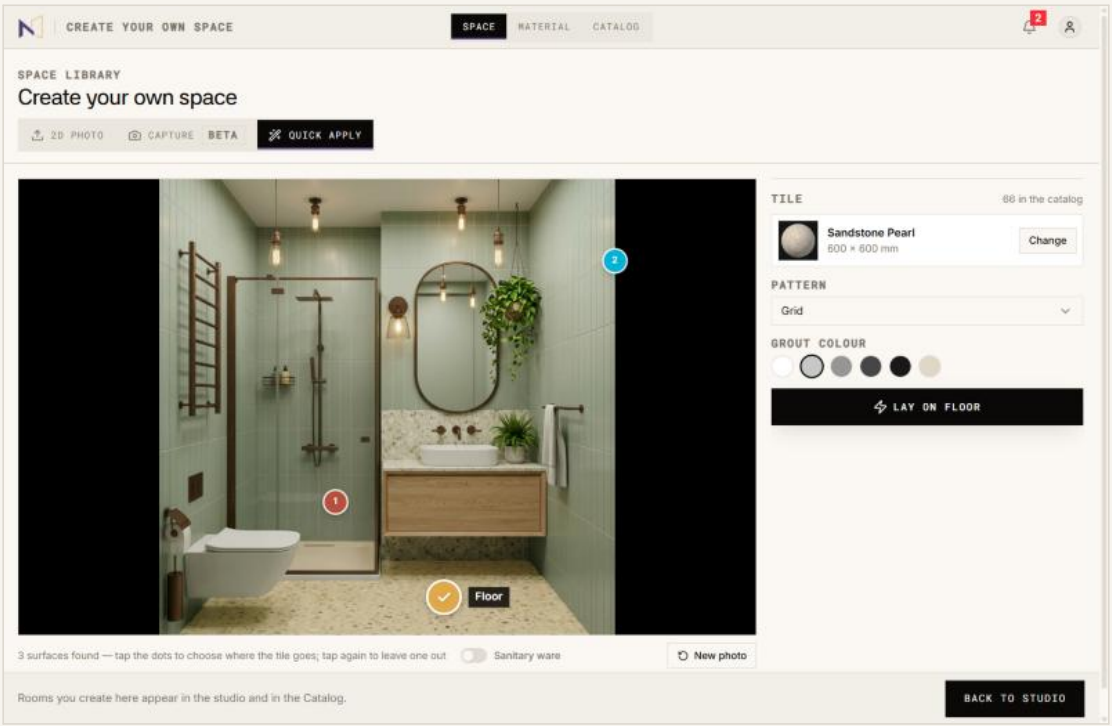

Quick apply, before a photo is added.

Tiling the photo

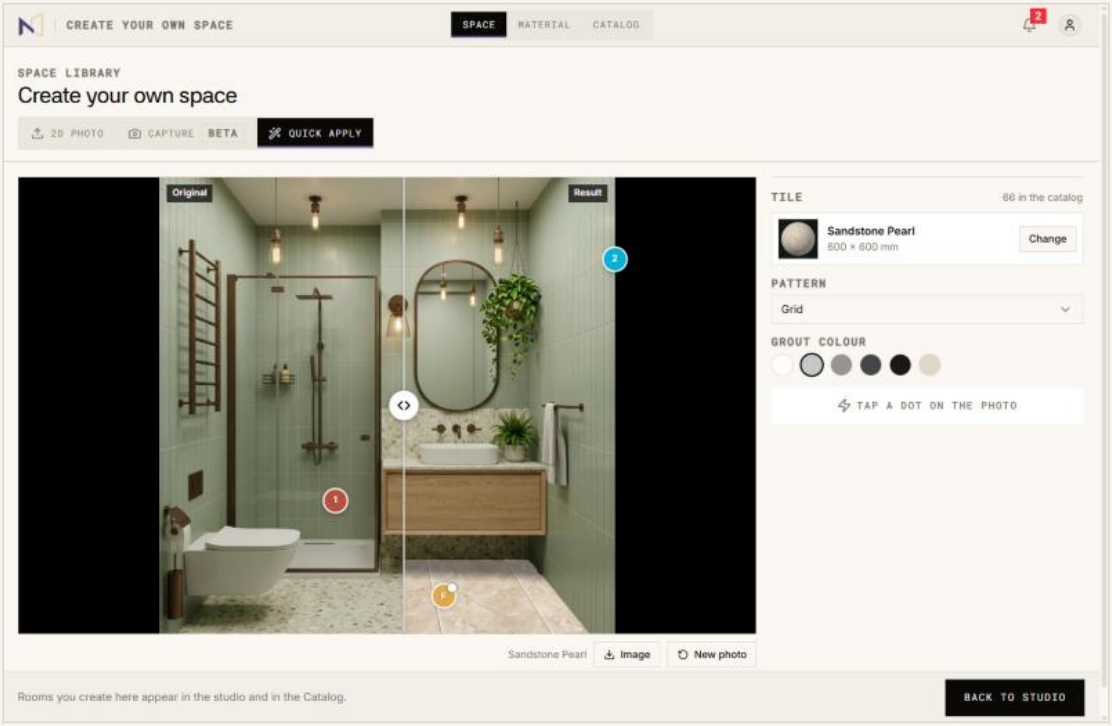

1. Tap the dots for the surfaces to tile; a tick shows each one picked. (If the **Sanitary ware** switch under the photo is on, turn it off first.)
2. Type a tile name or code under **Tile** and pick it.
3. Choose the **pattern** and **grout colour**, then press **Lay on …**.
4. Drag the **slider** on the result to compare before and after. **Image** downloads it; **New photo** starts again.

A photo read by Quick apply: one dot per surface.

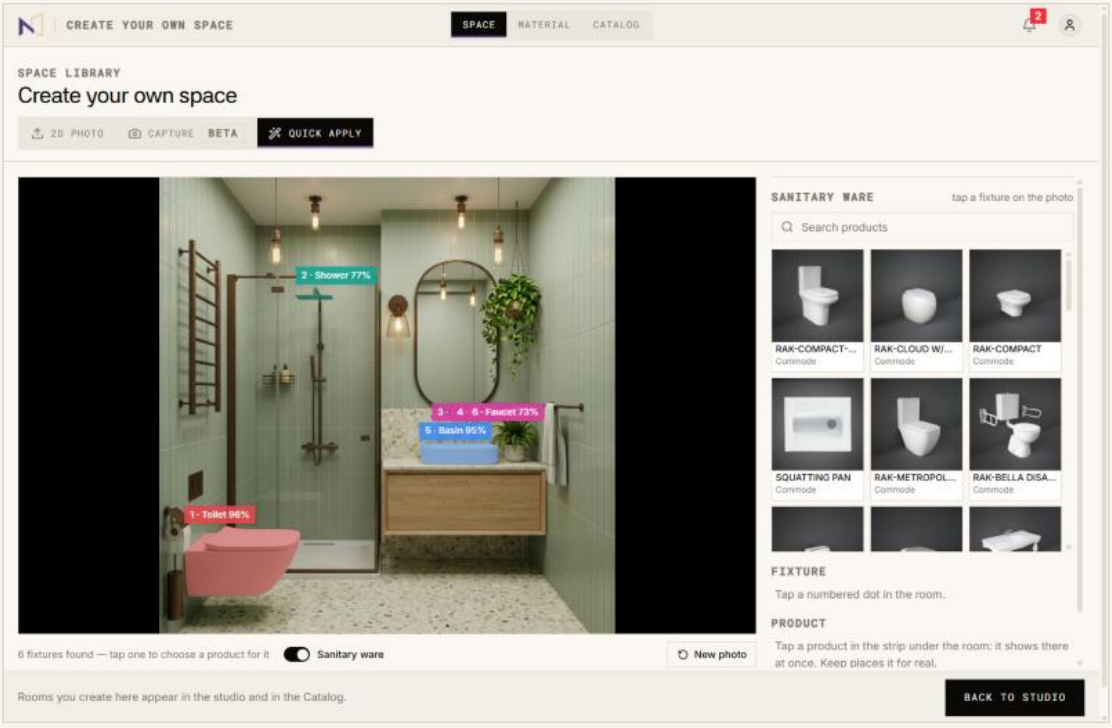

The floor picked (F) and Sandstone Pearl chosen.

The result: the original on the left of the slider, the new floor on the right.

Swapping sanitary ware

If fixtures were found, the **Sanitary ware** switch under the photo is on: the fixtures are marked on the photo and the panel on the right shows your sanitary catalog. Tap a fixture, pick a product that fits it, and press **Keep**. Turn the switch off to go back to tiles.

Quick apply with Sanitary ware on: six fixtures found and numbered, the sanitary catalog on the right.

SECTION 15

Tips and troubleshooting

The space library is empty	That is how a new account starts. Create a space (section 2).
The tile strip is empty	Your catalog has no approved tiles yet. Upload and approve some (section 3).
I can't see Manage catalog	Adding tiles and products is for company admins. Ask yours.
A new space is taking a while	Building takes a few minutes; the bell tells you when it is ready.
The tile looks the wrong size	Check **Size & joint**, then the room's real size (**Catalog** → **Set size**), and apply the tile again.
Measurements say "approx"	The room's real size is not known yet. Use **Set size** or **Set real length**.
A product is greyed out	It does not fit the fixture you picked. Pick a fixture of its kind.
The room looks too zoomed in	Scroll down (or pinch out) on the room, and drag to turn.
I want to undo	Open **History** and click an earlier version. Nothing is deleted.

Screenshots were taken in October 2026 on an account that already had spaces and tiles; your screens will be emptier until you add your own, and wording may differ slightly.
